

# Virtual Machine for JACoW (JACoW Editor VM)

Raphael Mueller

on behalf of JACoW

# Agenda

- Cumbersome Proceedings Office Setup
- Alternatives?
  - Cloning
  - Combined Installer (MSI/NSIS)
  - ImageX / Windows AIK (Automated Installation Kit)
- The „JACoW Editor VM“
  - Install
  - Activate
  - Uninstall
- Conclusions
- References

# Cumbersome Proceedings Office Setup

- During e.g. ICALEPCS '09 we had to set-up all computers manually (takes some hours)
- Sometimes software is missing
- Products are most of the time not configured properly (JACoW-MediaBox, Destiller Settings missing etc.)
- Goal
  - Providing an easy way to setup and configure the machines up front saves the editors time.
  - Enables them to work on more important tasks.

# Alternatives

## Cloning / Combined Installer

- Cloning
  - Platform dependent
  - At least one machine needs to be setup properly (and sometimes that was already a problem)
- Combined Installer
  - High maintenance
  - Compatibility issues
    - Some software already installed?
    - Platform issues (32/64-bit, Windows/.NET versions) ?

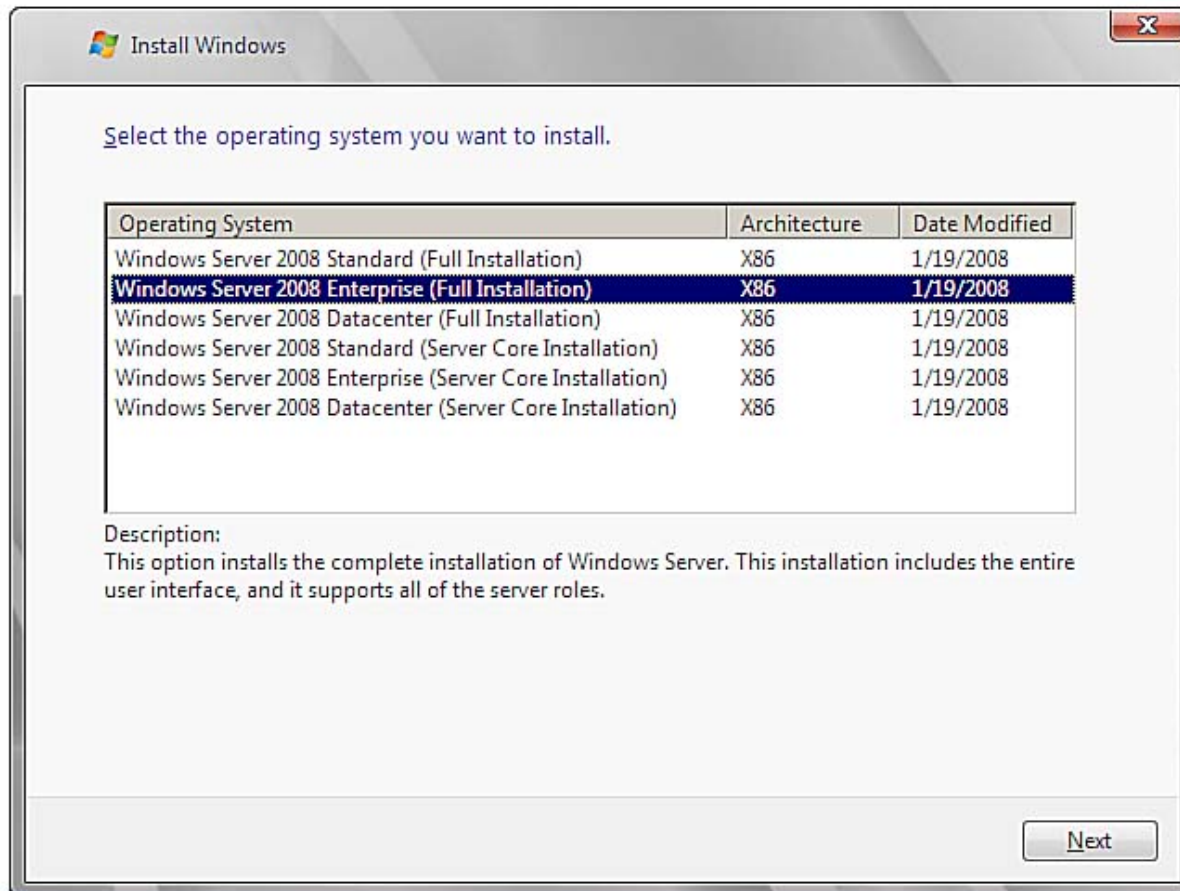

# Alternatives

## ImageX / Windows AIK (1)

- ImageX / Windows AIK (Automated Installation Kit)
  - Only available for newer Windows versions (Vista / Win7)
  - All computers need to be installed from scratch (also Windows)
    - You can use ImageX only to capture and to apply a full version of the operating system and software applications. You cannot use ImageX to capture and to apply upgrades to the operating system or applications.
  - Complicated image capture process through a Windows PE environment

# Alternatives

## ImageX / Windows AIK (2)

A selfmade image would also show up in the OS list.

# The „JACoW Editor VM“

## Basics

- Virtual Machine (VM) sim-/emulates a real machine
- Programs only see the interfaces of the VM, not of the underlying system
- Based on VMWare's VMPlayer product (free for personal and non-commercial use)
- VMPlayer exists for several platforms (Linux 32/64-bit, Windows 32/64-bit)

# The „JACoW Editor VM“

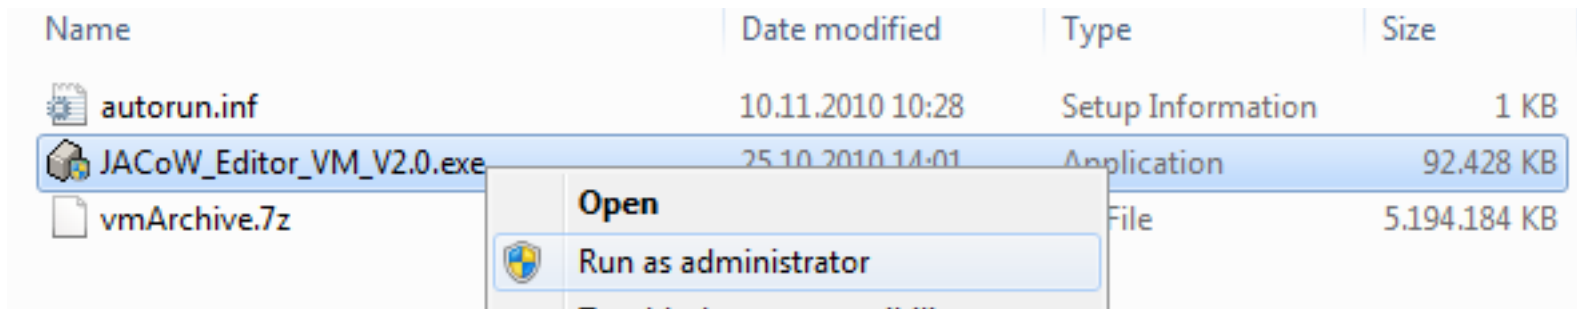

## Pre-Installed Software

- Licensed Software
  - Windows XP Professional English (needs serial), Adobe Acrobat 7.x.x (JACoW license), Enfocus PitStop Professional 7.x (JACoW license)
- Free/Open Source
  - JACoW PS Printer Driver, OpenOffice, Mozilla FireFox, GhostScript, GSView, MikTex (2.8), TeXnicCenter, 7-Zip, IrfanView, Paint.NET, JAVA 6, FileZilla FTP, Putty, Defraggler, ImgBurn, Media Player Classic
- 30day Trials
  - Speed Commander, WinEdt, WinZip

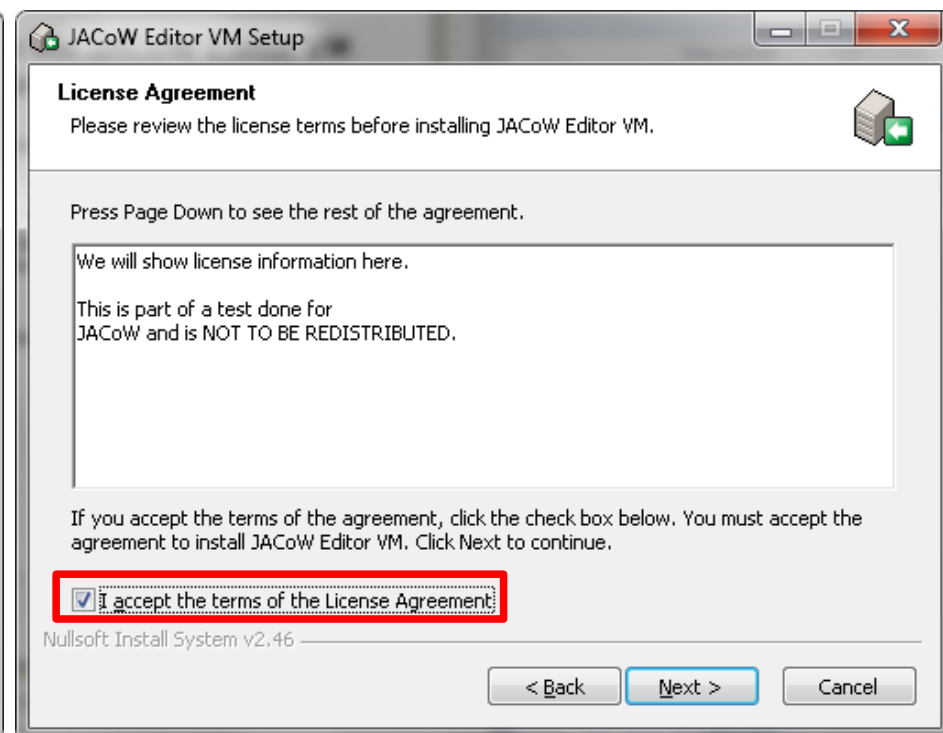

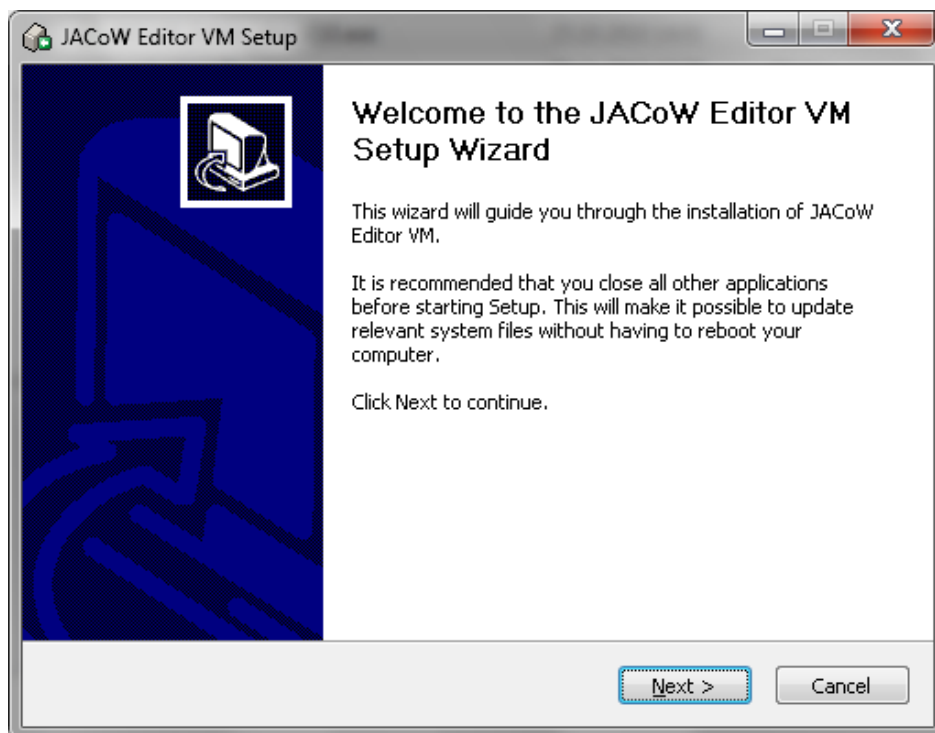

# The „JACoW Editor VM“ - Install (1)

- No download available at the moment (size 6GB)
- Execute the installer through right-clicking it and choose „Run as administrator...”

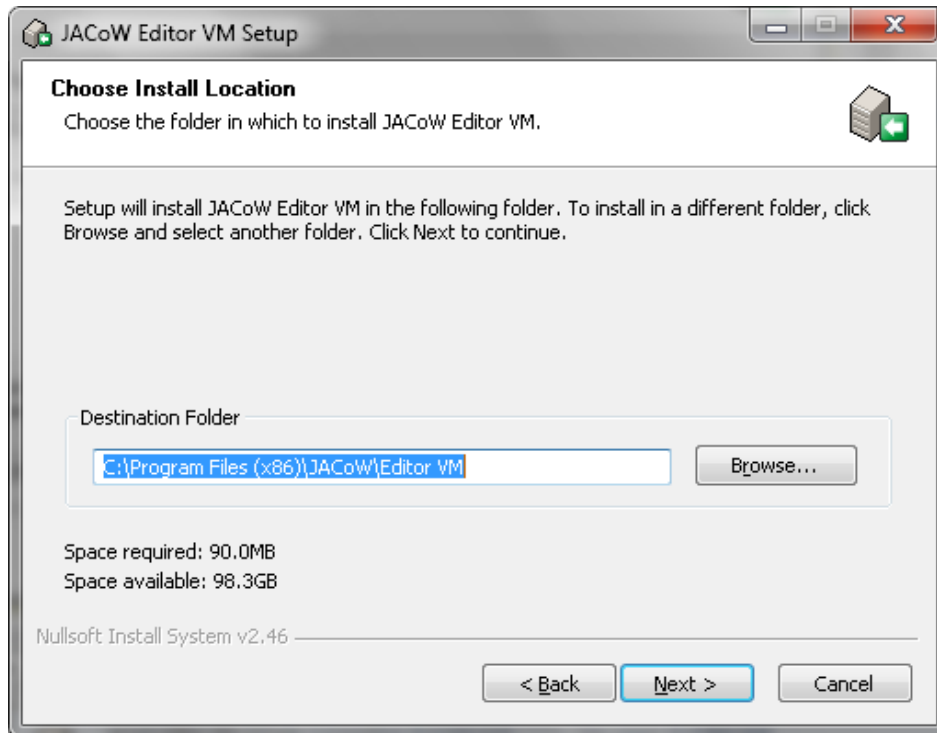

# The „JACoW Editor VM“ - Install (2)

- Installing is done through an NSIS step-by-step installer
- Possibility for license information foreseen

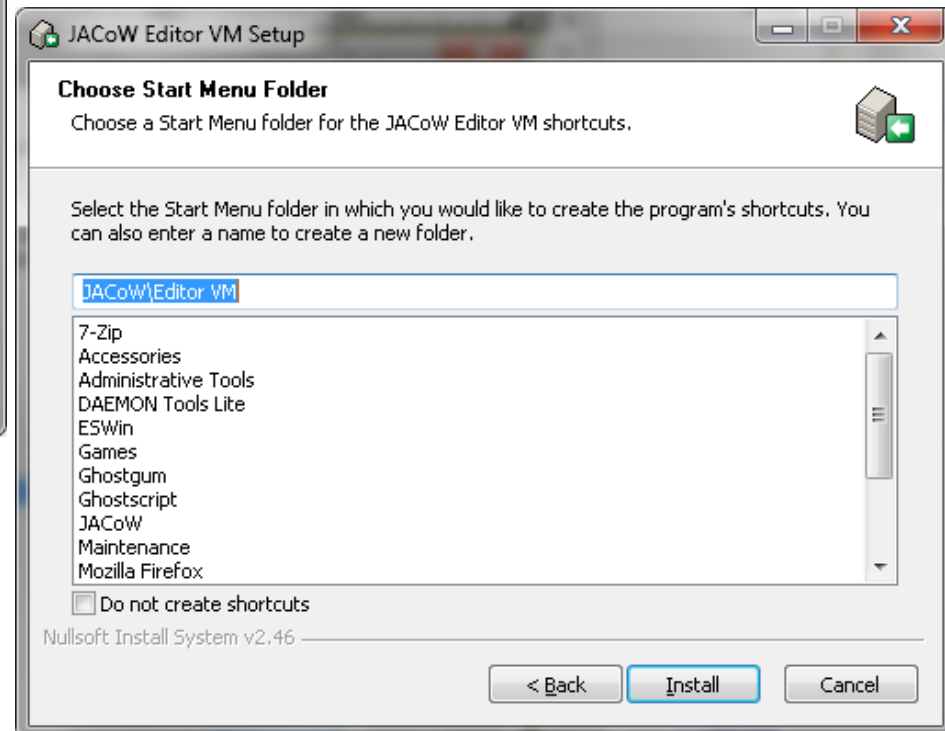

# The „JACoW Editor VM“ - Install (3)

Choose a destination for the VM files

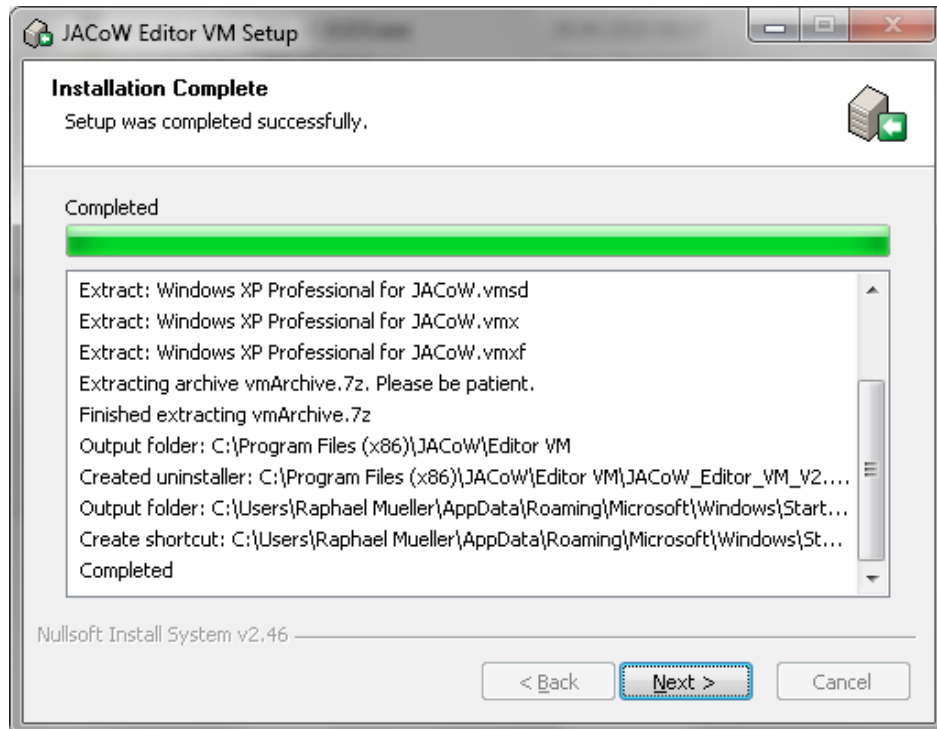

Create Start Menu shortcuts (suggested!)

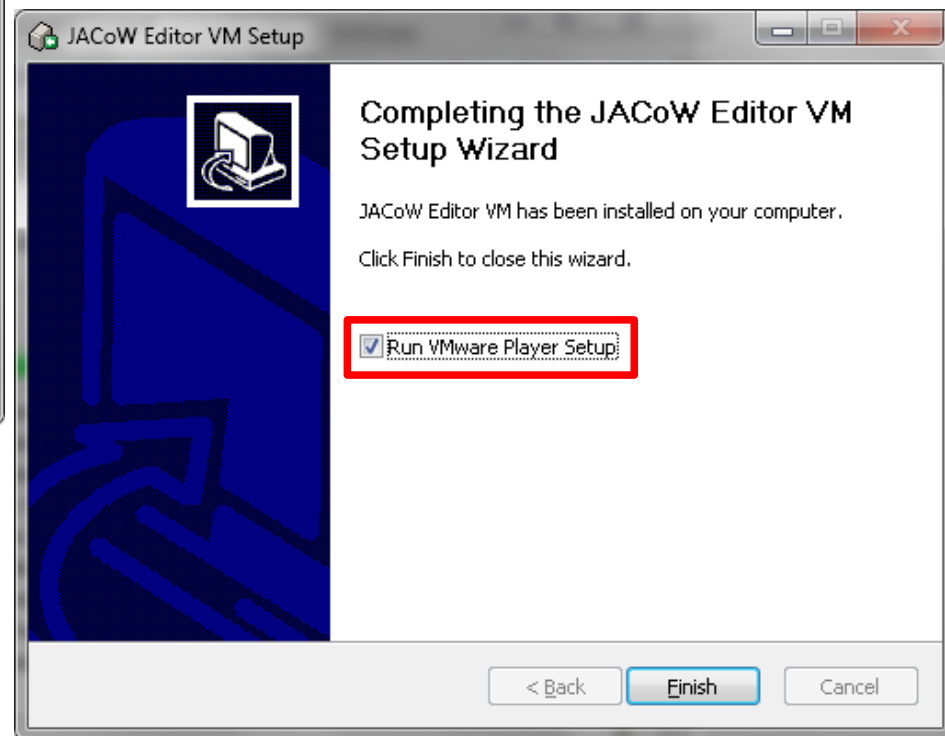

# The „JACoW Editor VM“ - Install (4)

Wait patiently (extracting 6 GB takes time)

If it is not already installed run also VMware Player Setup

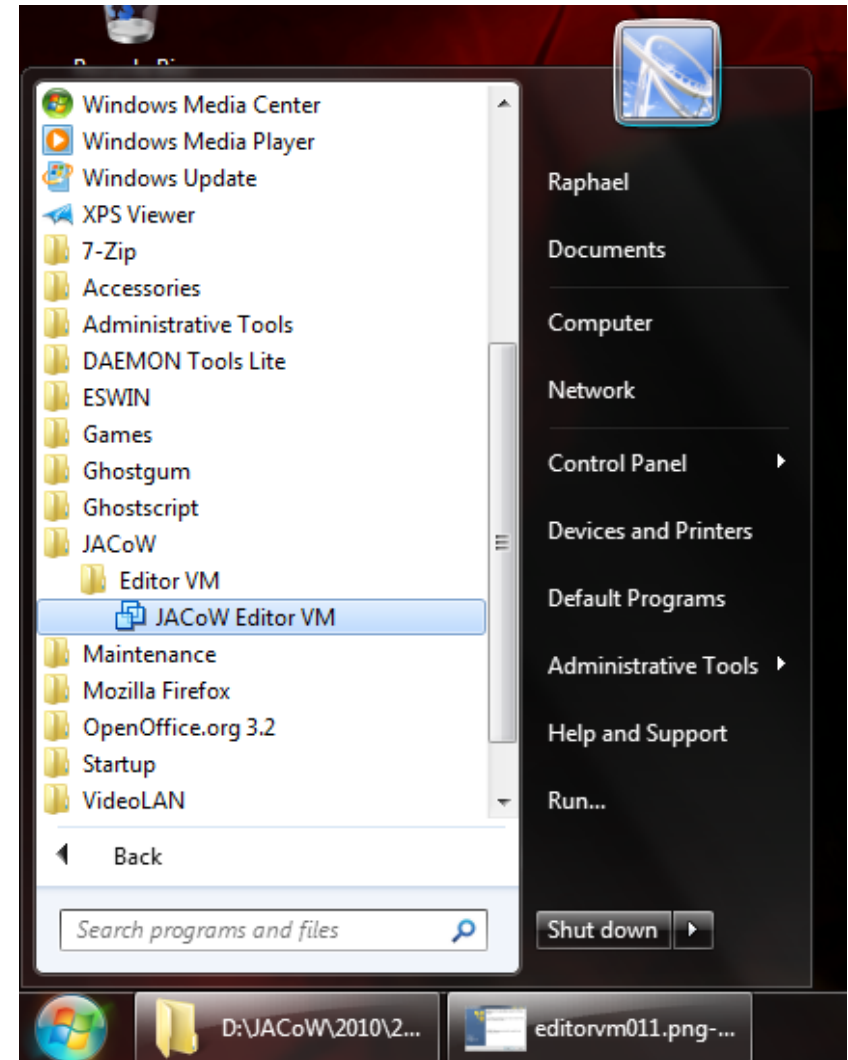

# The „JACoW Editor VM“ - Install (5)

For details on VMplayer setup visit [www.vmware.com](http://www.vmware.com)

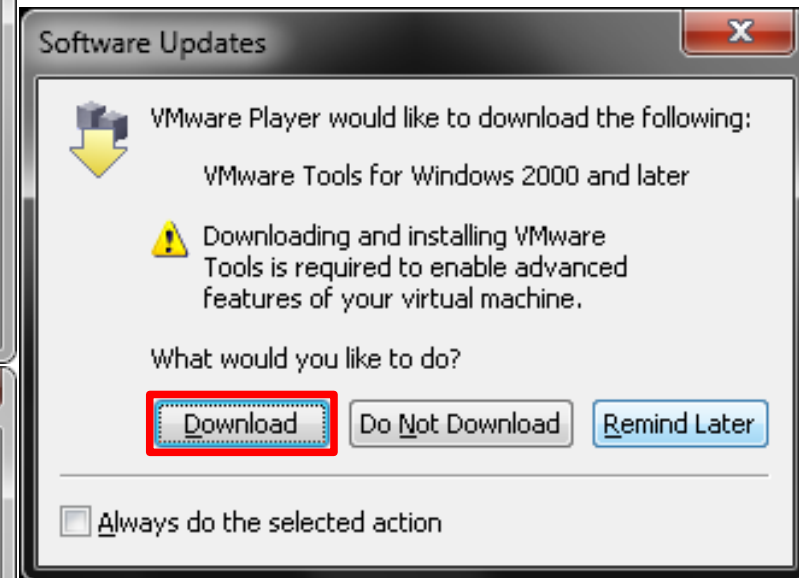

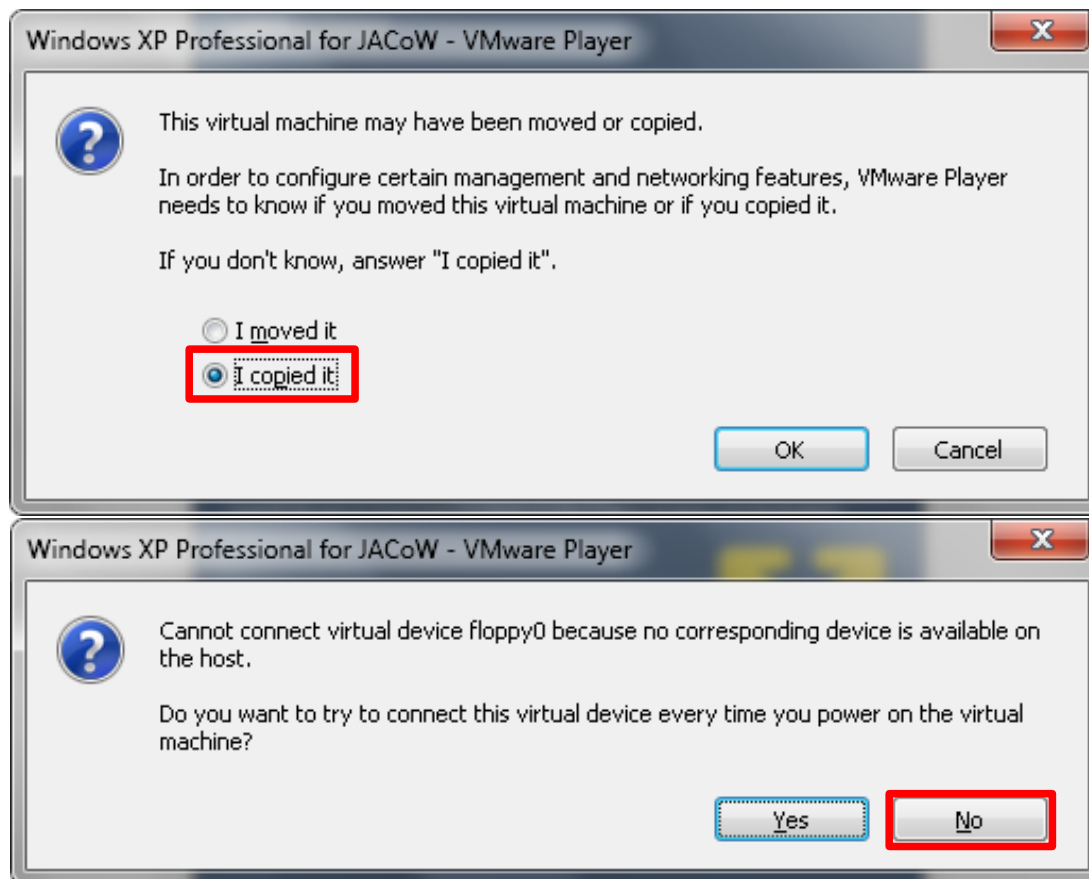

The Result after installing →

# The „JACoW Editor VM“ - Activate (1)

On first startup answer some questions for the VM...

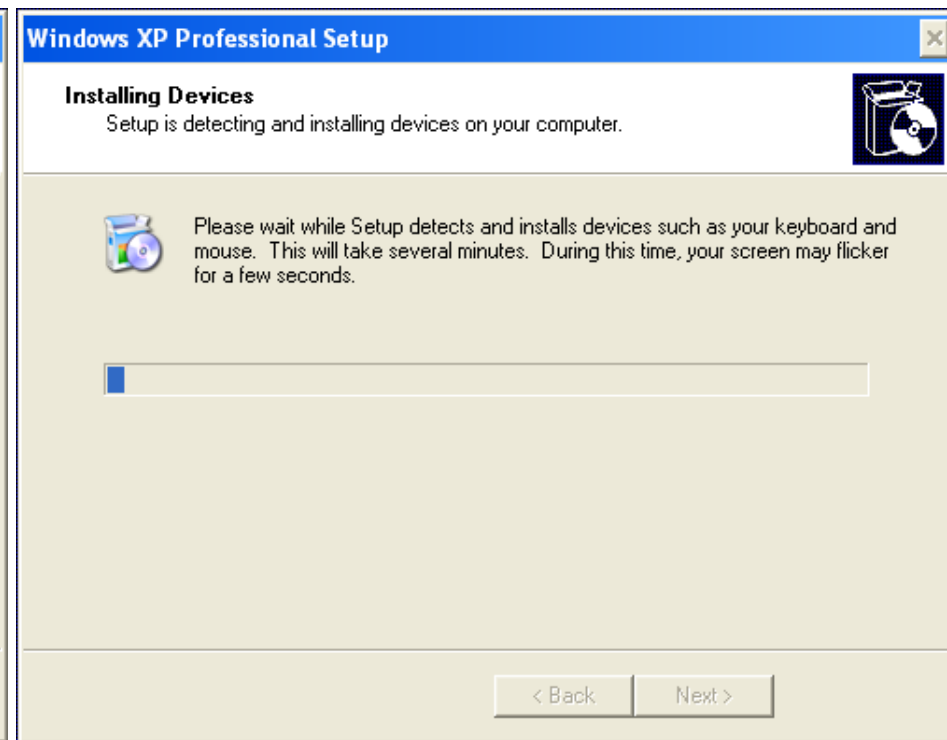

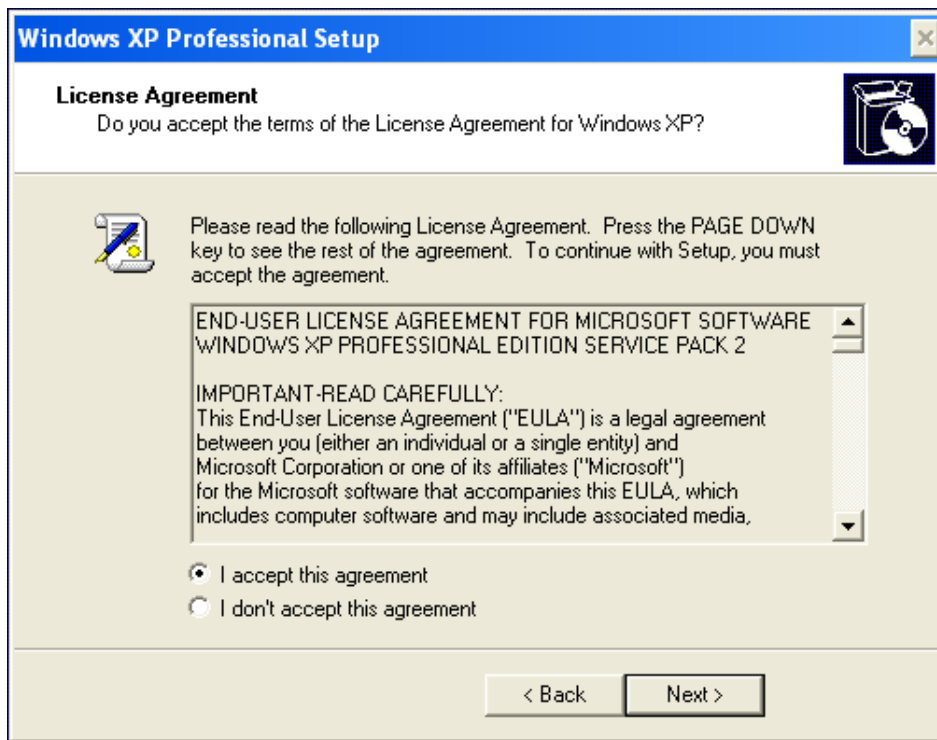

# The „JACoW Editor VM“ - Activate (2)

After that a Windows Mini-Setup follows that configures this Windows XP Instance

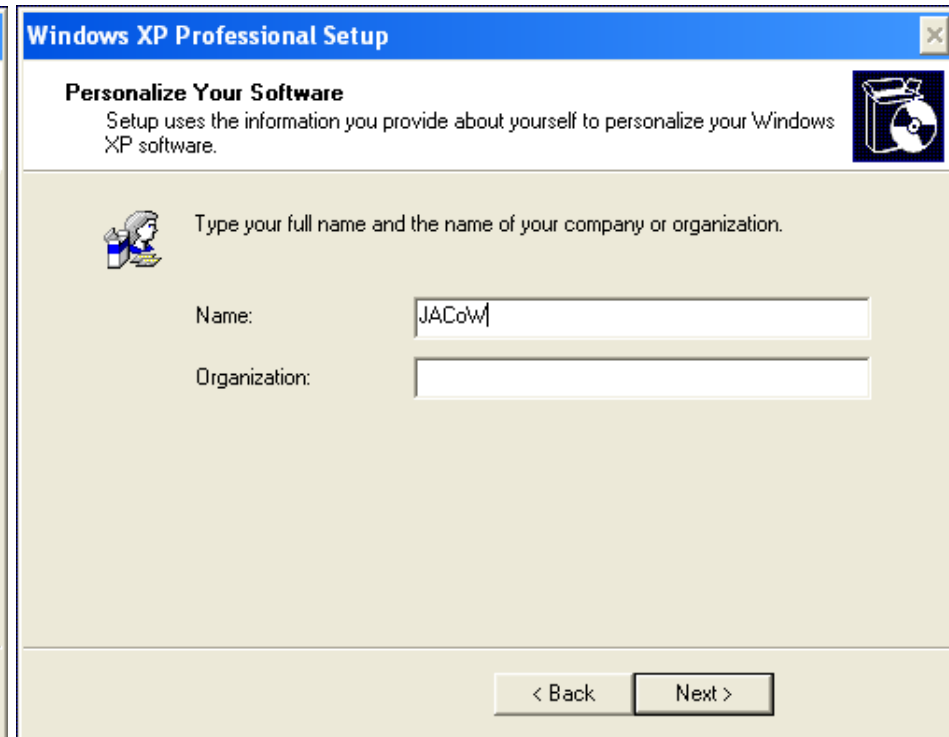

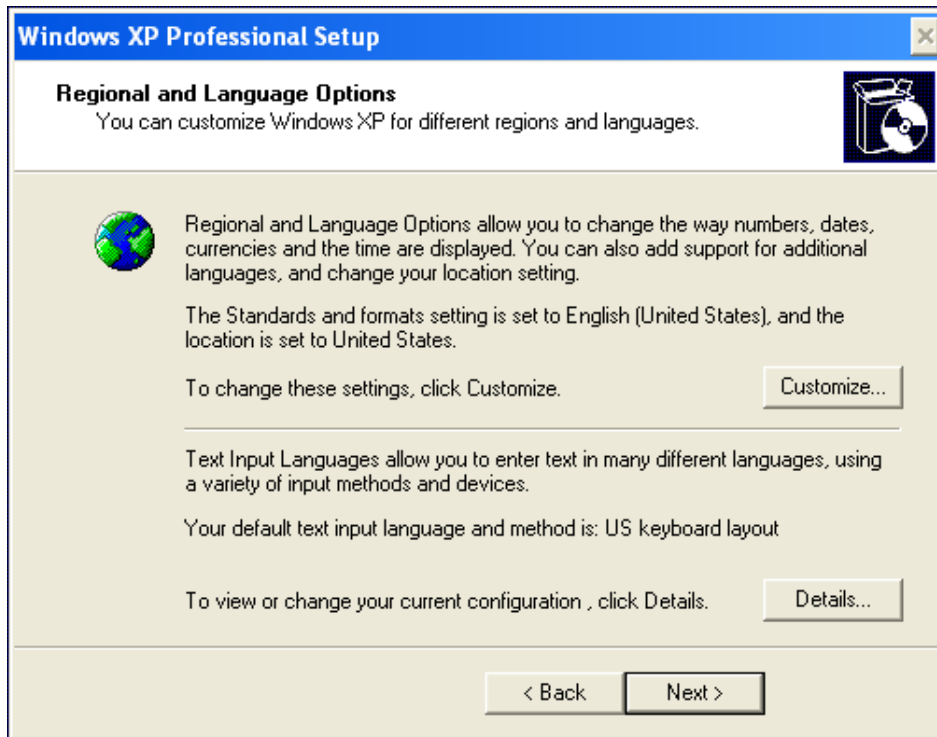

# The „JACoW Editor VM“ - Activate (3)

The Mini-Setup asks the common setup questions about EULA and does hardware detection

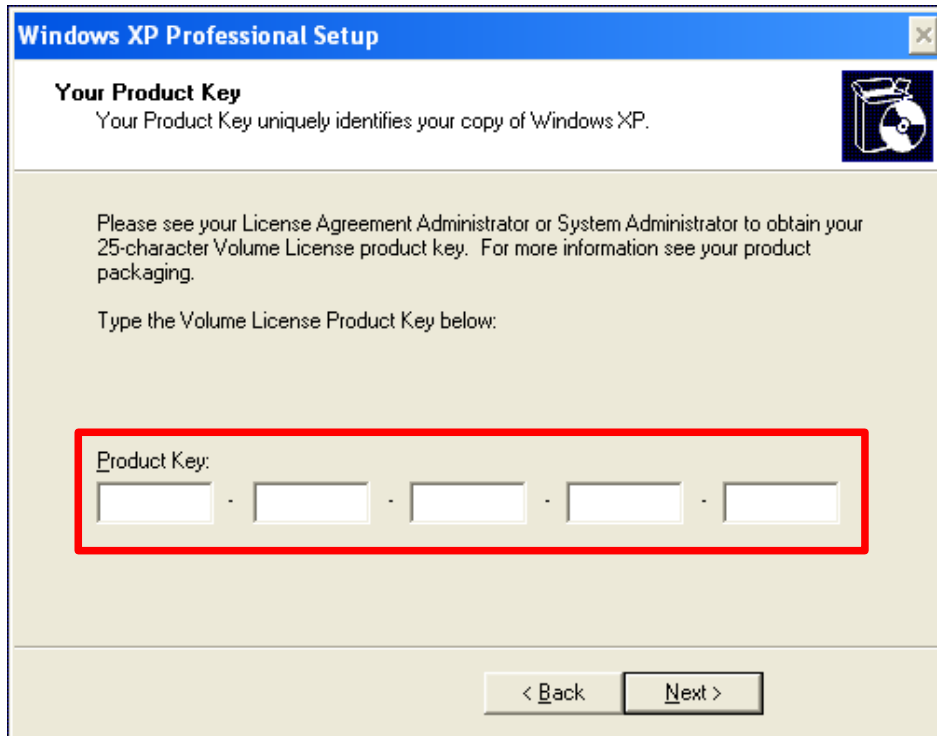

# The „JACoW Editor VM“ - Activate (4)

Also setting language (best leave to english) and owner information is required as usual...

# The „JACoW Editor VM“ - Activate (5)

Serial depends on  
Windows version in VM.  
At the moment: Windows  
XP, English, 32-bit

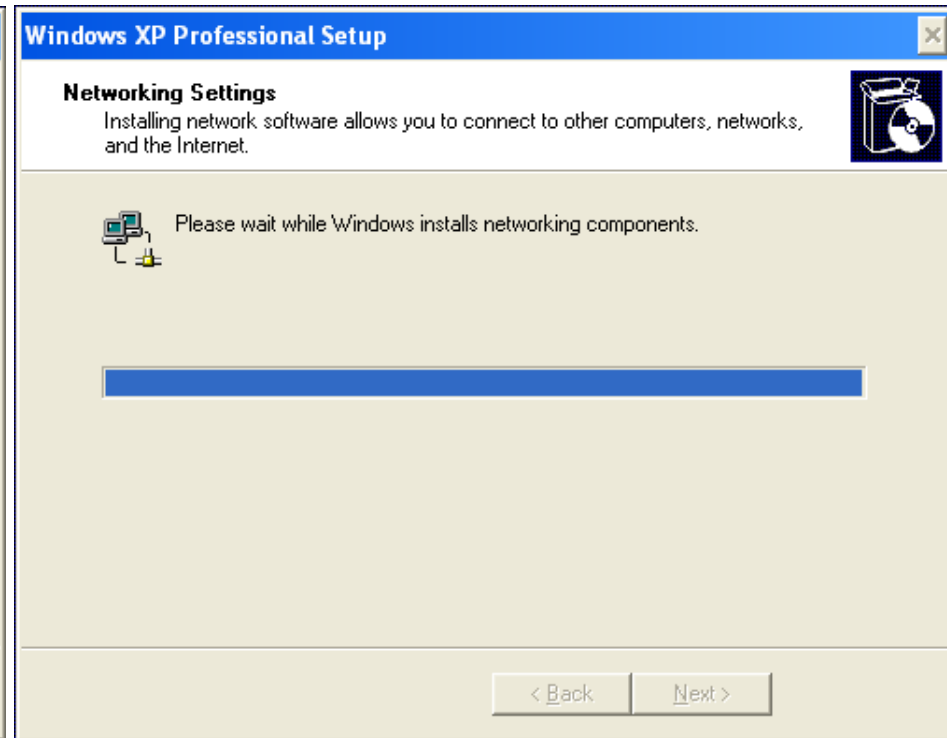

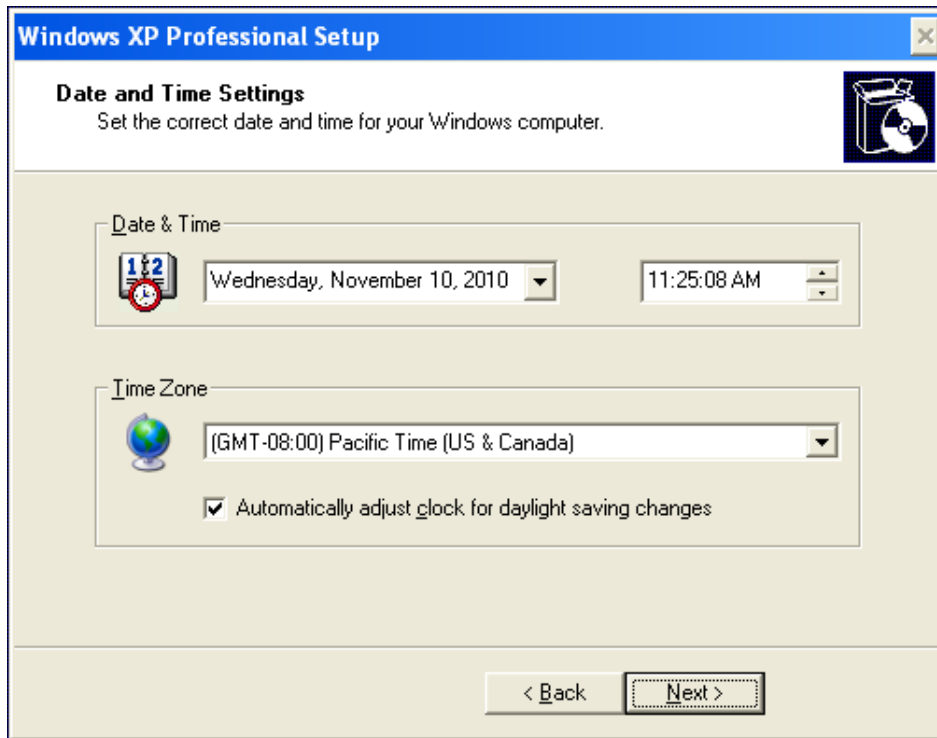

Remember computer  
name you assign! In  
case of PitStop licensing  
problems you need it.

# The „JACoW Editor VM“ - Activate (6)

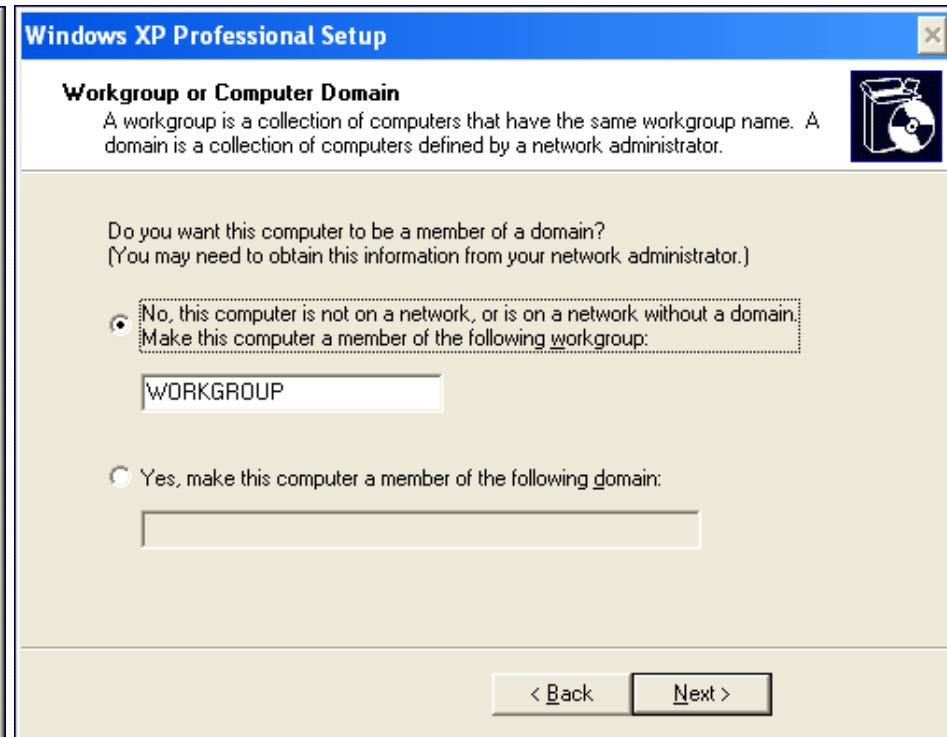

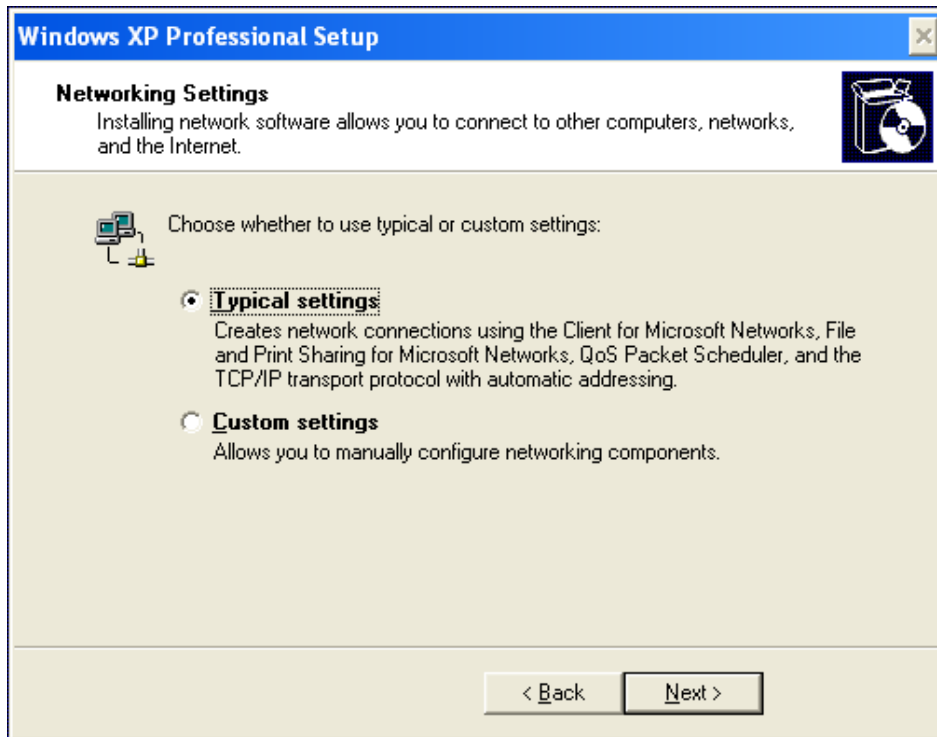

Time and networks settings that you would also specify during a regular Windows installation

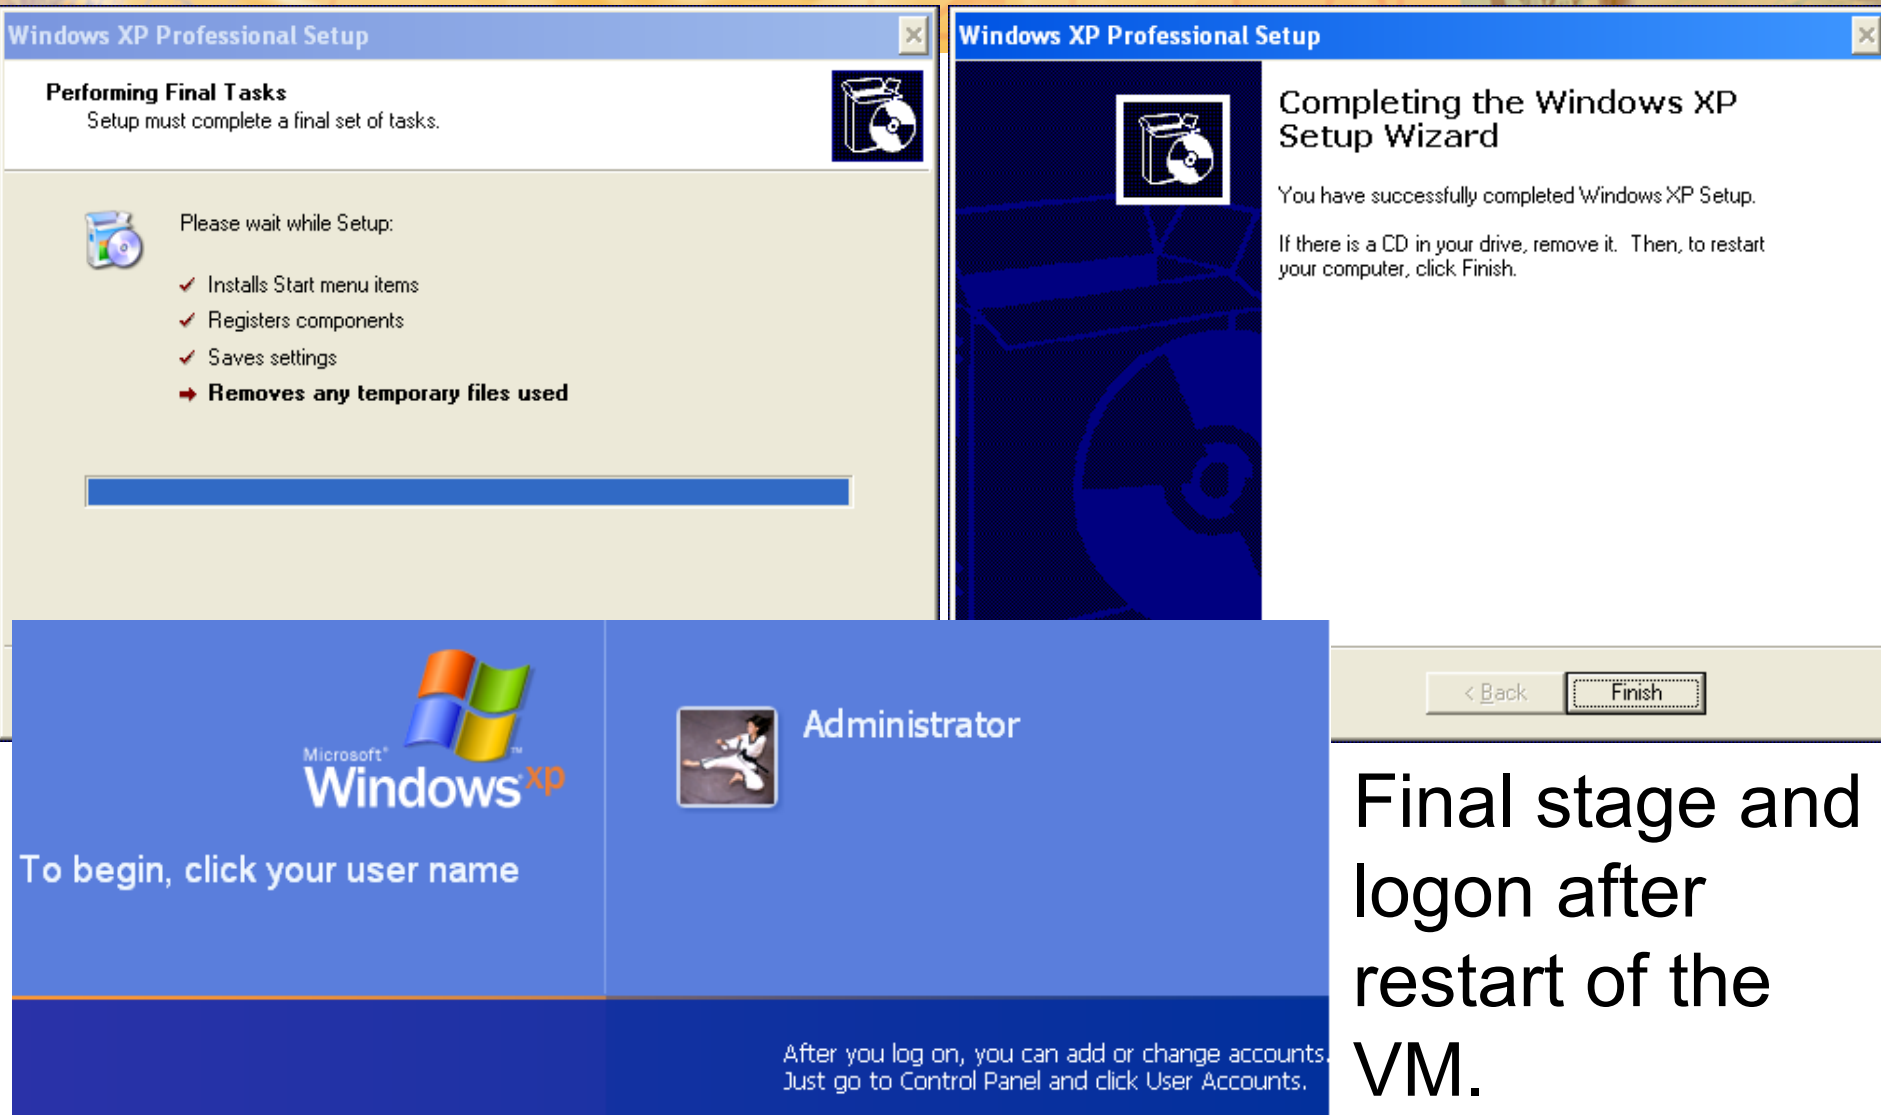

# The „JACoW Editor VM“ - Activate (7)

Network details, most of the time the default settings are sufficient.

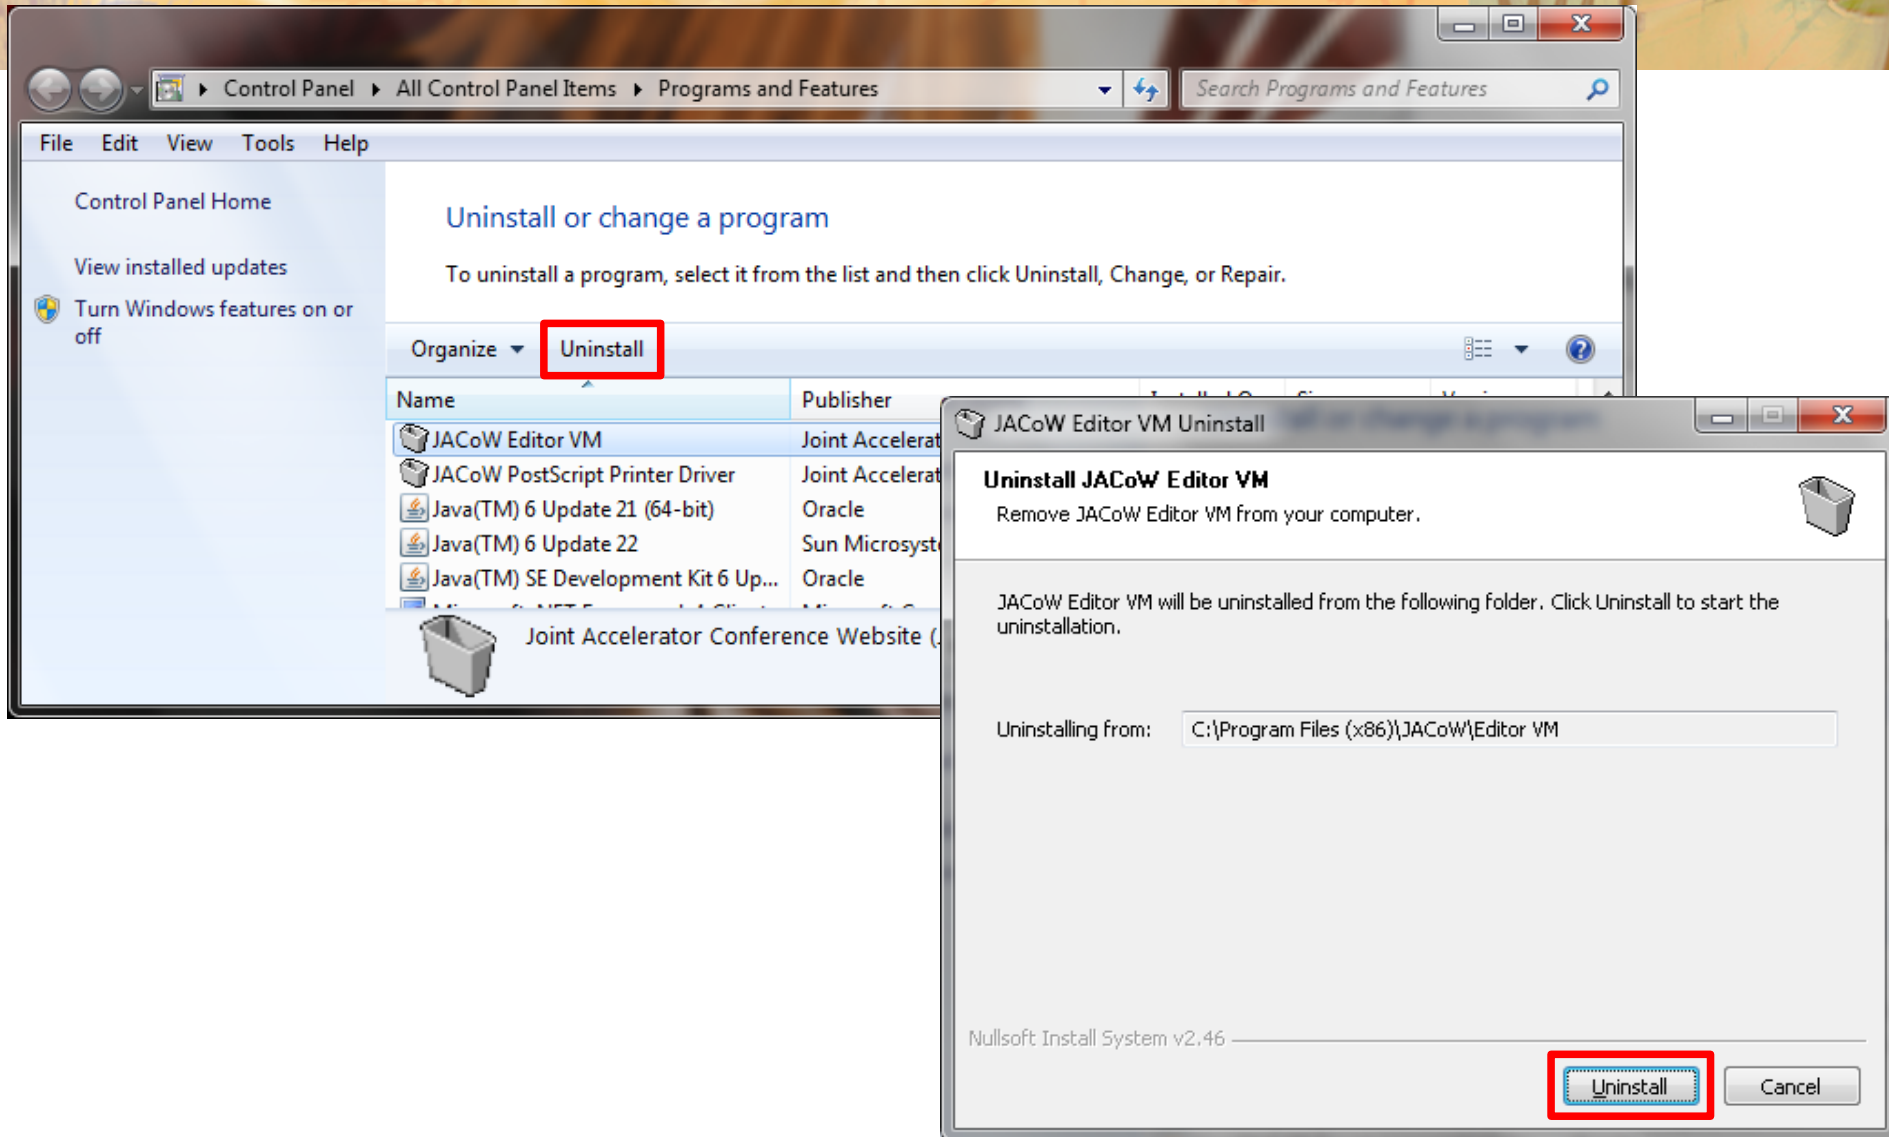

# The „JACoW Editor VM“ - Activate (8)

Final stage and logon after restart of the VM.

# The „JACoW Editor VM“ - Uninstall

# Conclusions (1)

- Done
  - Created a sealed Virtual Machine Image with Windows XP Pro & Editor Software using VMWare Player
  - Created an installer for easy setup of VMWare Player & the VM
  - Testing was done on Win7/Vista/XP
    - Windows XP 32bit @ Intel Core2Duo E8400, 2GB
    - Vista 64bit @ AMD Neo 1.6 Ghz (single core), 2GB
    - Windows 7 32bit @ Intel Core2Quad Q6600, 4GB
    - Windows 7 64bit @ AMD Neo 1.6 Ghz (single core), 2GB
  - Successfull used at FEL '10 (only ?)

# Conclusions (2)

- ToDo
  - Further investigation of licensing issues (e.g. what about XP licenses)
  - XP Serials are bound to language, platform and version only specific serials (English & 32-bit & Professional) work for activating the current VM
  - Preparing the OS for deployment (SysPrep) removes some configuration (solution needed)
  - Test alternative virtualization tools (VirtualBox, qemu, ...)
