SACLA 2011~
X-ray Free Electron Laser

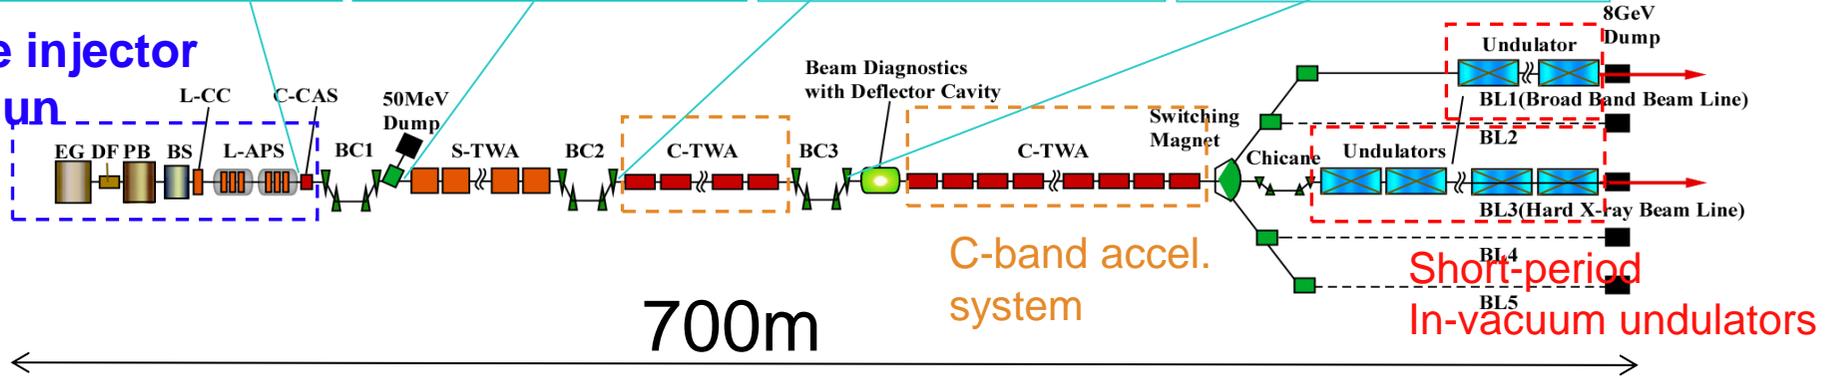

SACLA First Lasing June 7, 2011

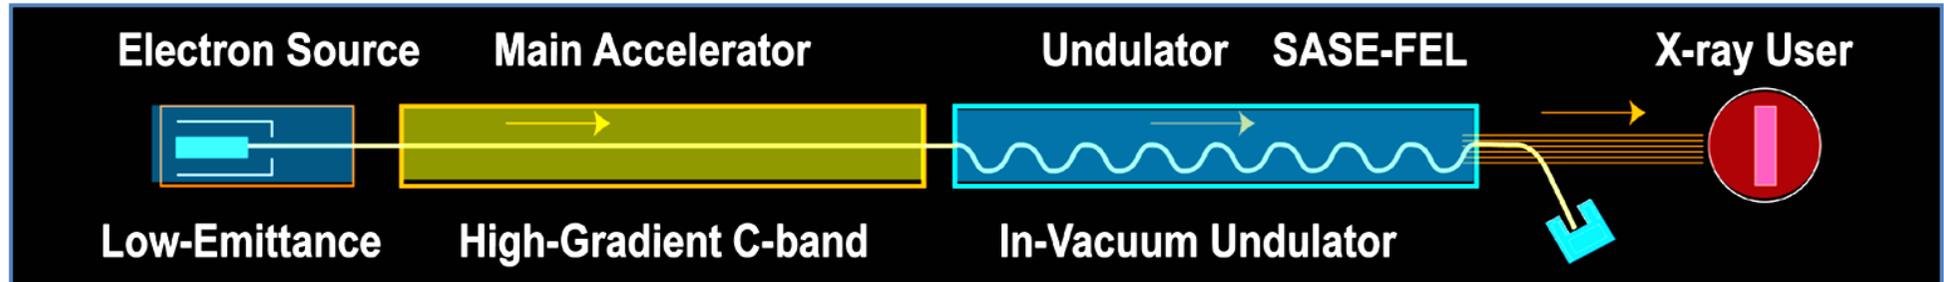

SACLA Accelerator

Low emittance injector with CeB6 E-gun

SCSS : SPring-8 Compact SASE Source

■ Short Period Undulator

Lower Beam Energy

In-Vacuum Undulator : $\lambda_u = 18 \text{ mm}$, $K=1.9$, $\lambda_x < 1 \text{ \AA}$ \rightarrow $E = 8 \text{ GeV}$,

SLAC-LCLS : $\lambda_u = 30 \text{ mm}$, $K=3.7$, $\lambda_x \sim 1.5 \text{ \AA}$ \rightarrow $E = 14 \text{ GeV}$

Euro-XFEL : $\lambda_u = 36 \text{ mm}$, $K=3.3$, $\lambda_x < 1 \text{ \AA}$ \rightarrow $E = 17.5 \text{ GeV}$

■ High Gradient Accelerator

Short Accelerator Length

8 GeV, C-band 35 MV/m \rightarrow 230 m

SLAC-LCLS : S-band 19 MV/m \rightarrow 740 m

■ Thermionic Electron Source

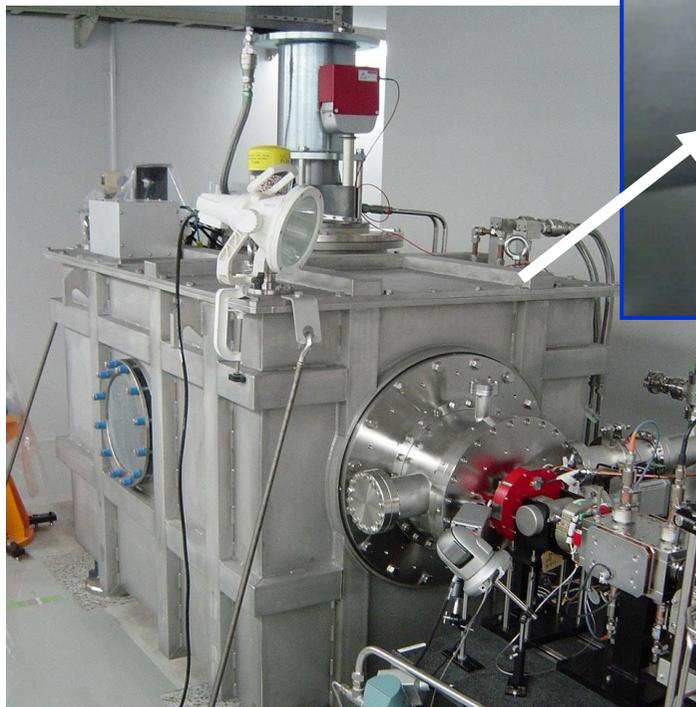

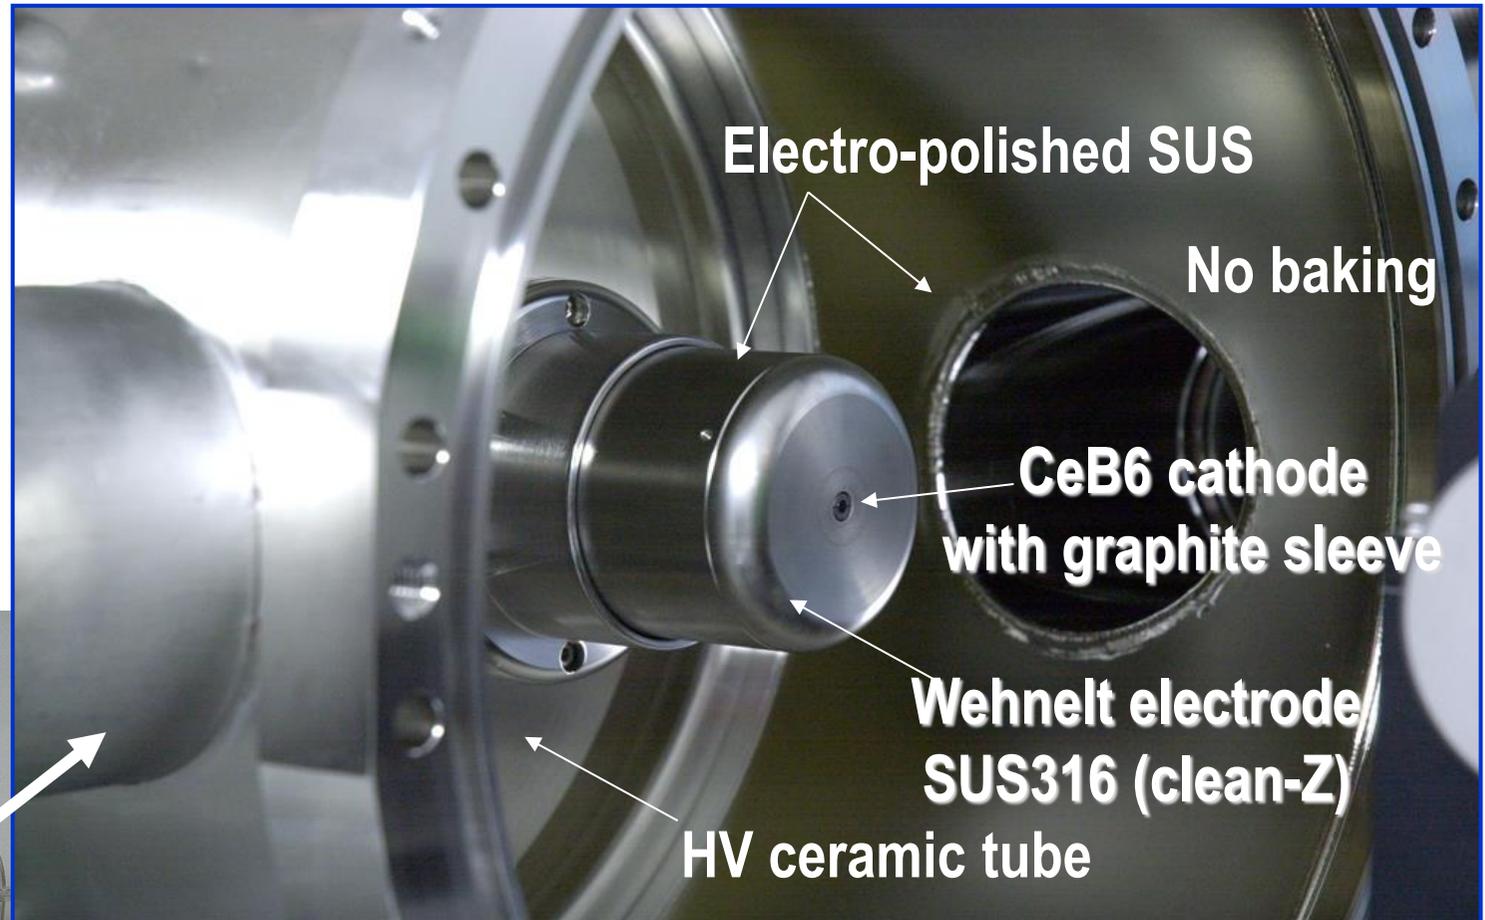

Short Saturation Length

Thermionic gun + velocity bunching \rightarrow $0.8 \pi \cdot \text{mm} \cdot \text{mrad}$ @ 3k A, 8GeV

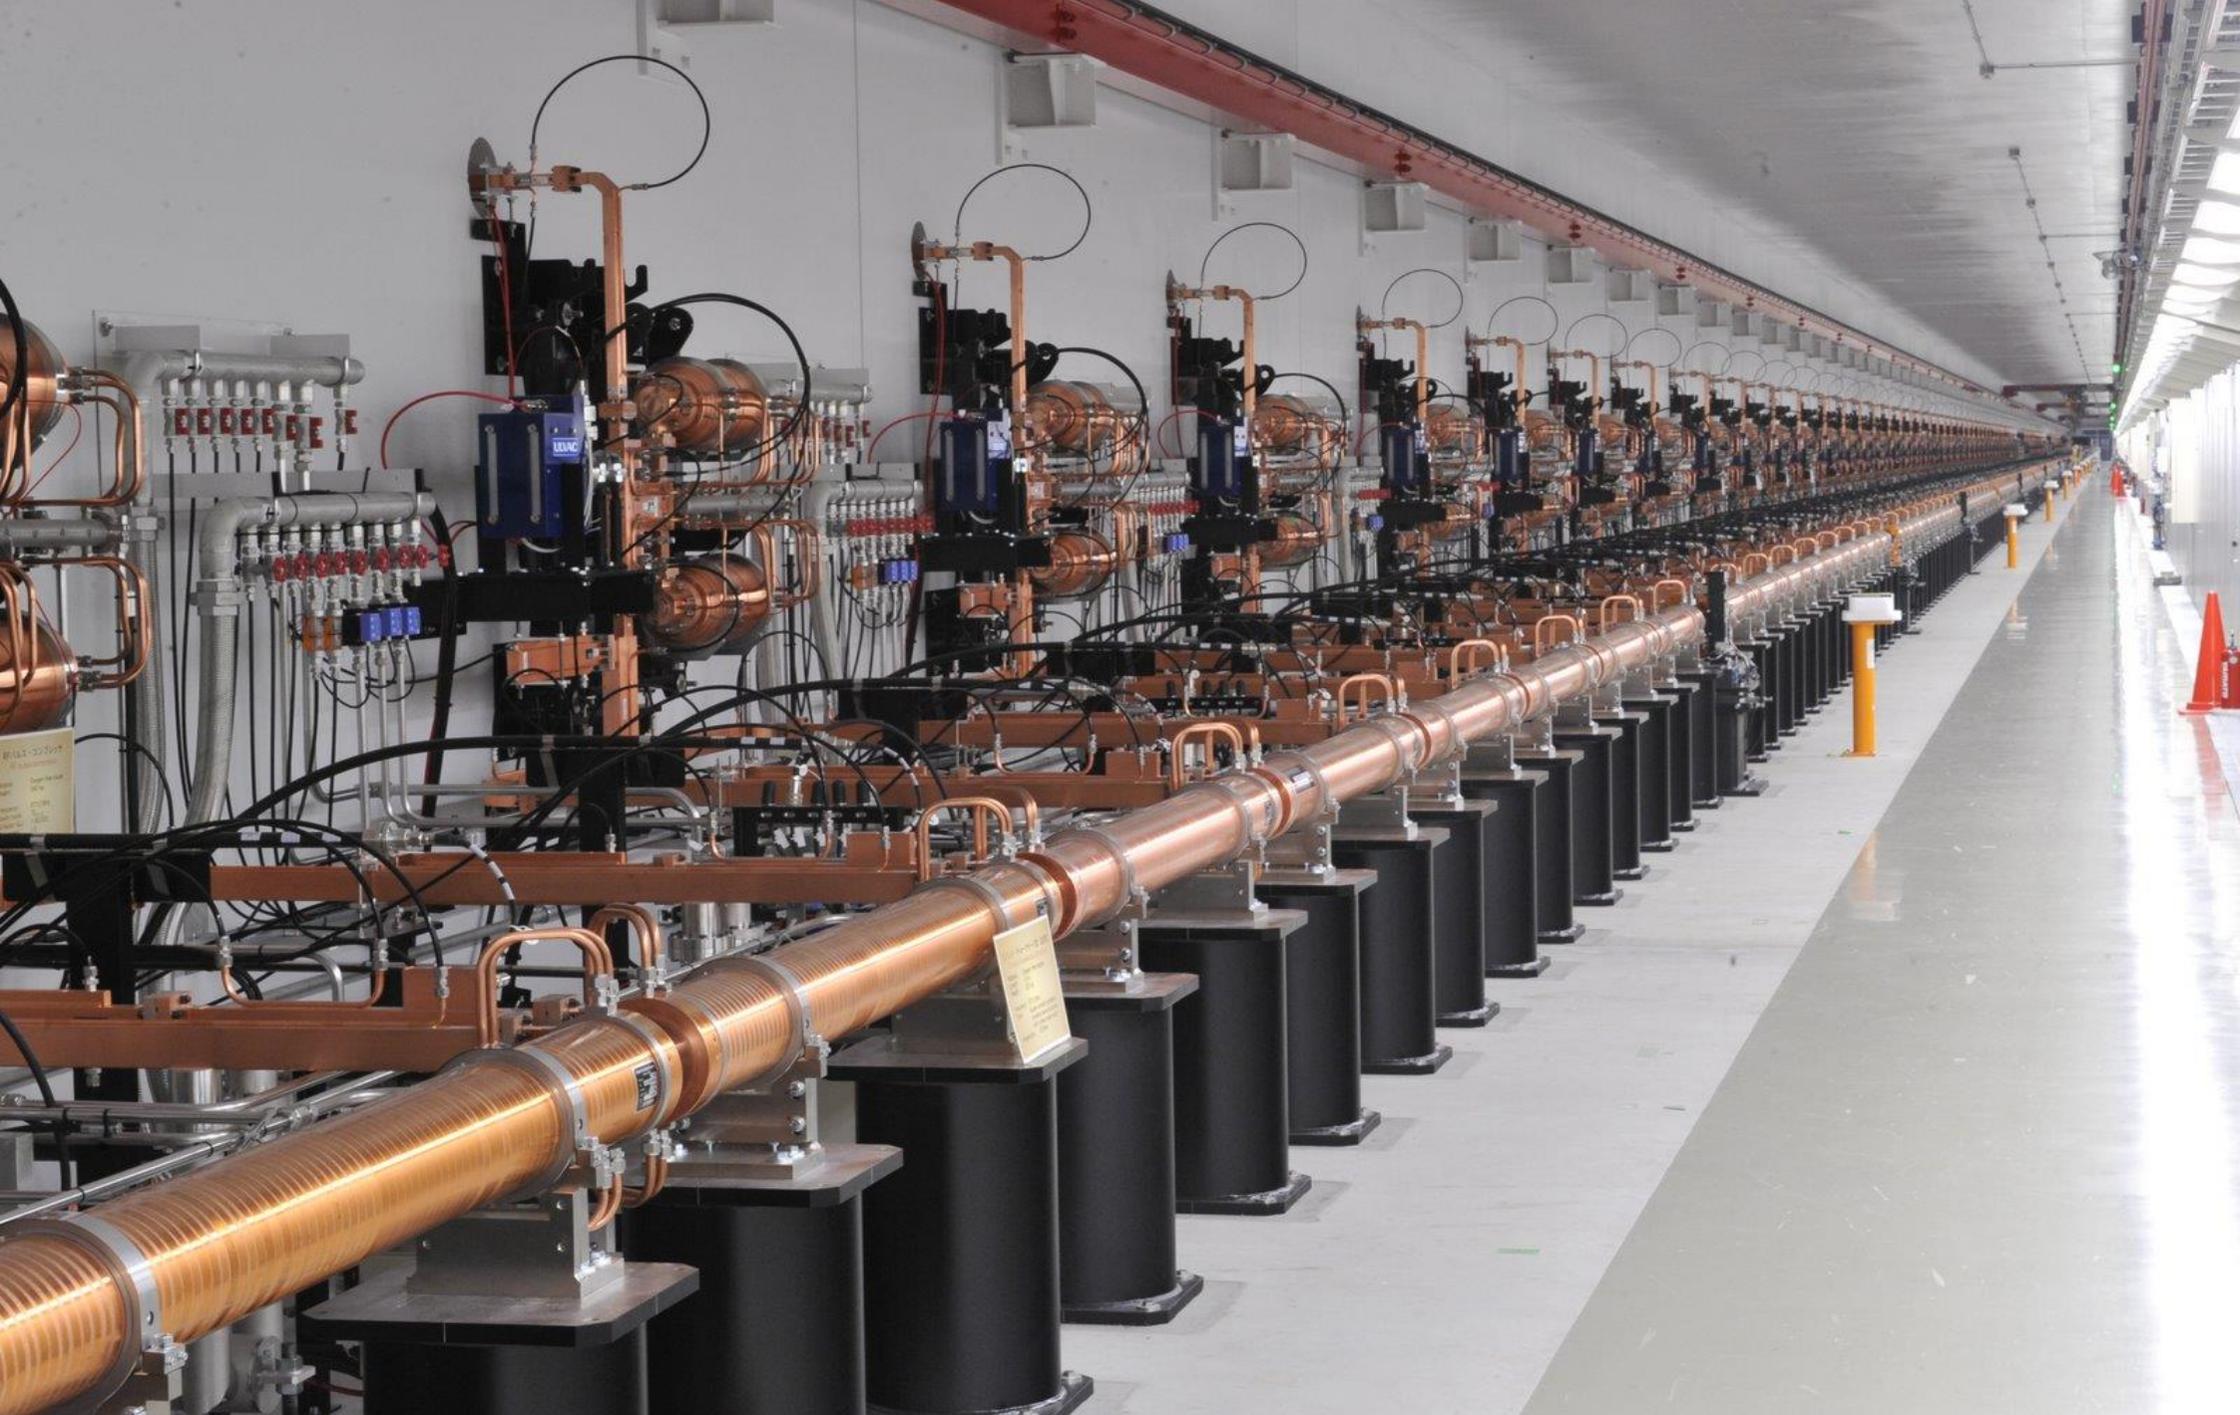

\rightarrow multi-bunch operation, smooth & quiet beam for seeding

Operational Experience of 500 kV Gun in SCSS Test Accelerator

- Applying 500 kV pulse.
- 3 micro-sec pulse driven by klystron modulator.
- Gun sits inside HV pulse tank, filled with oil.

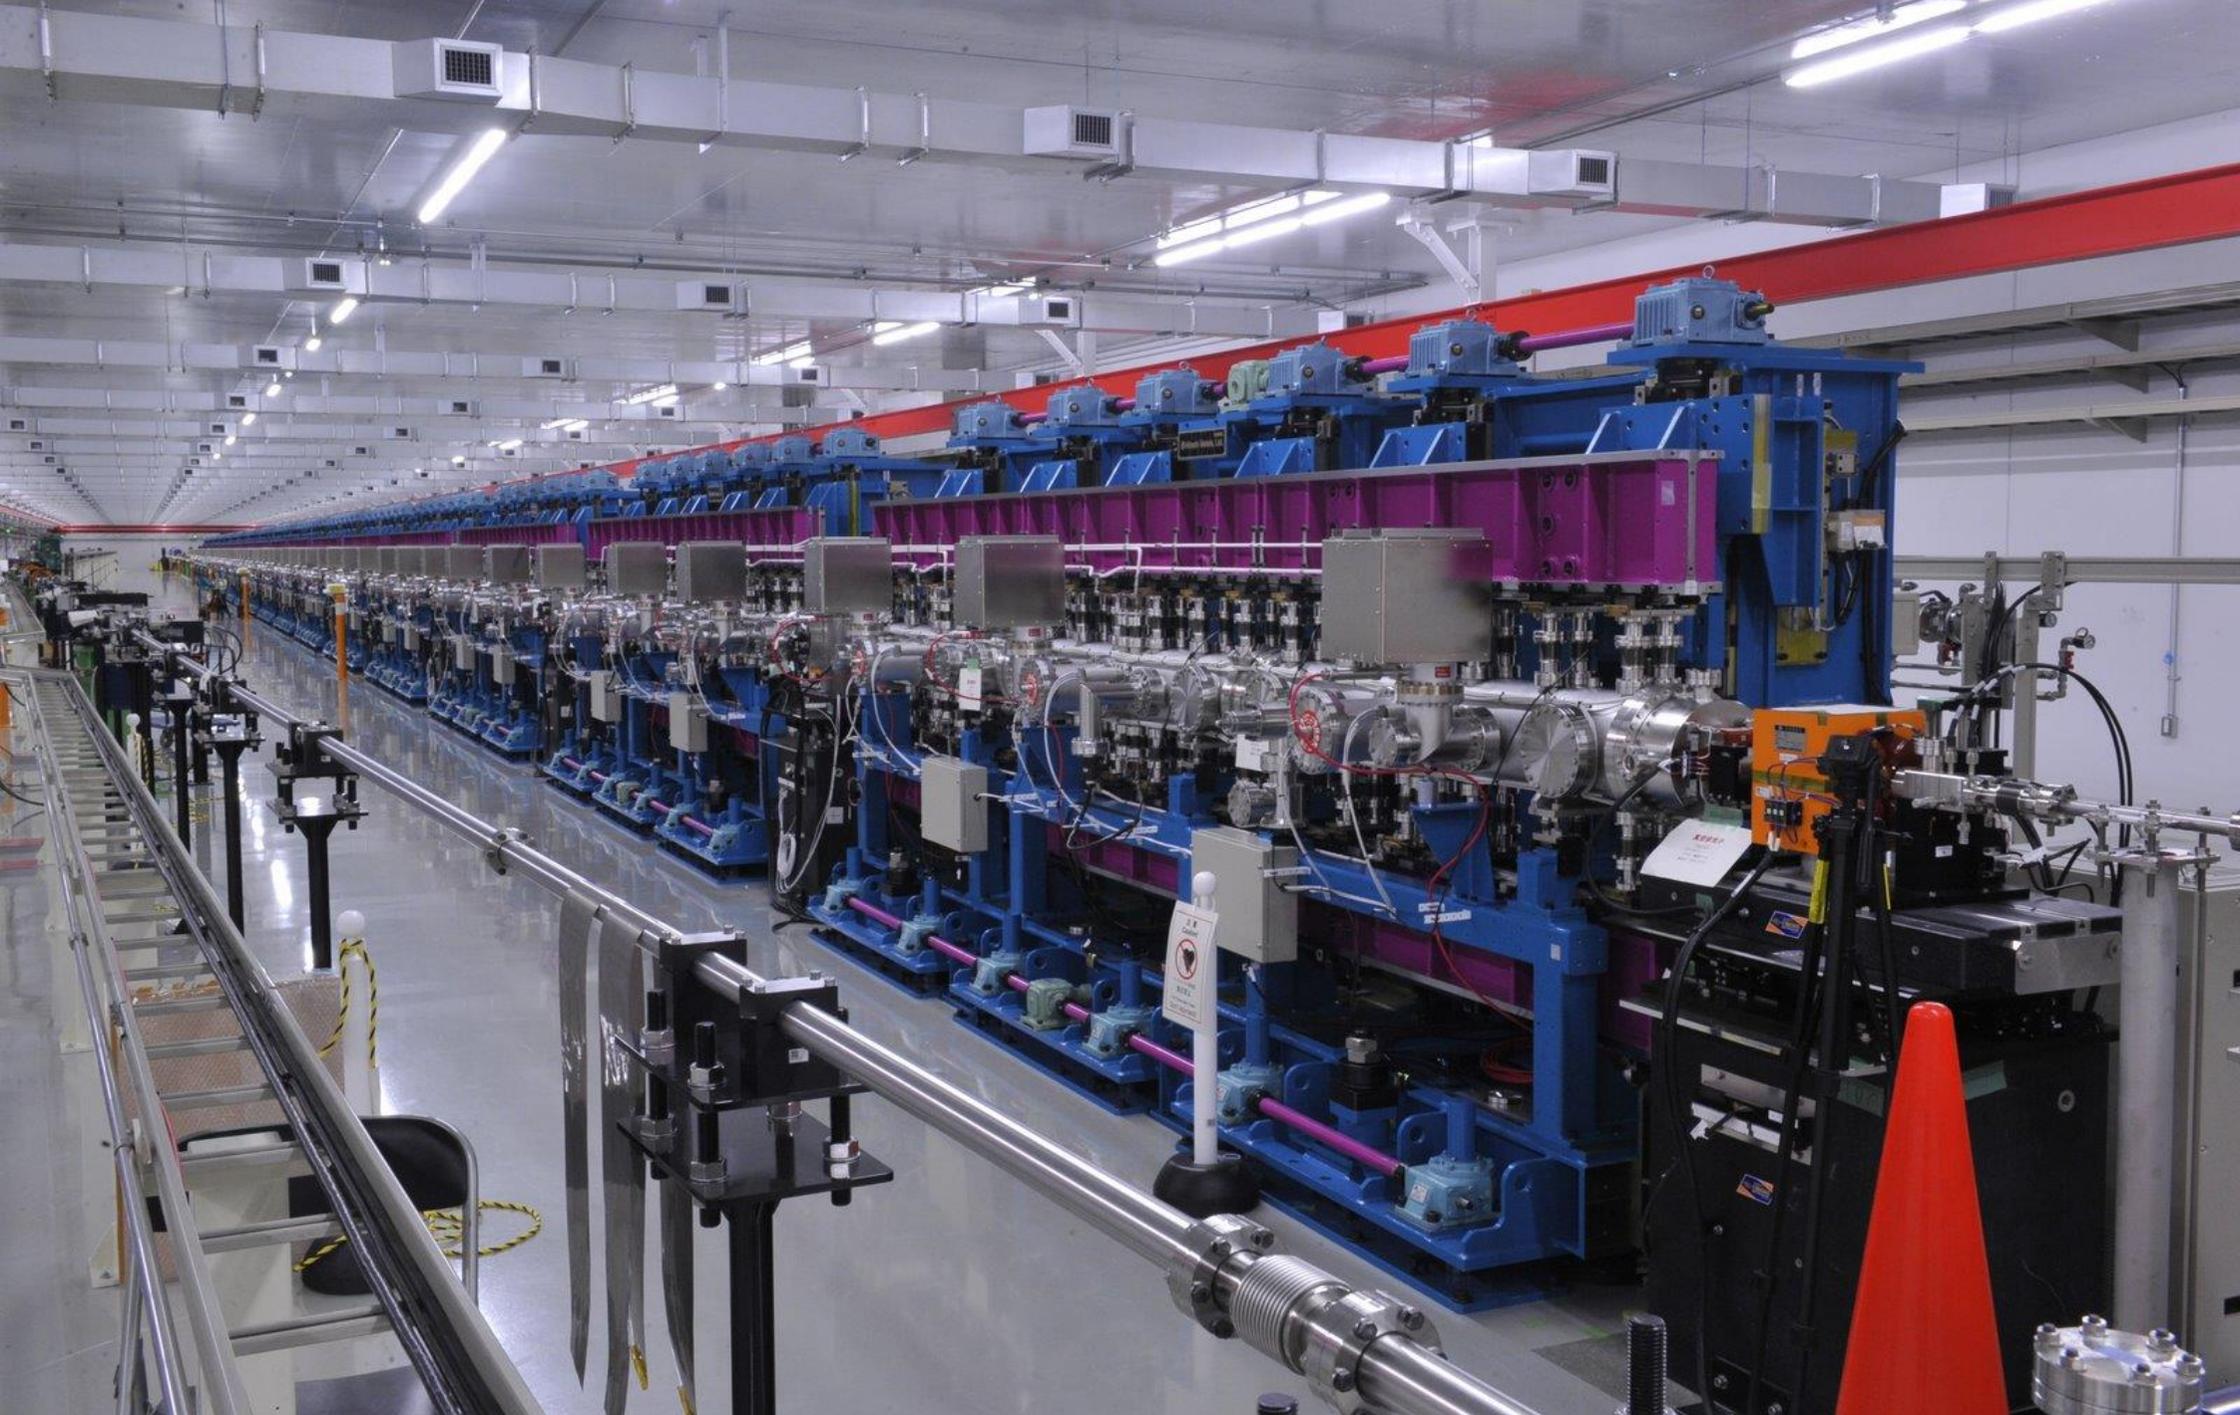

- *No HV breakdown at 500 kV for 4 years, daily operation.*

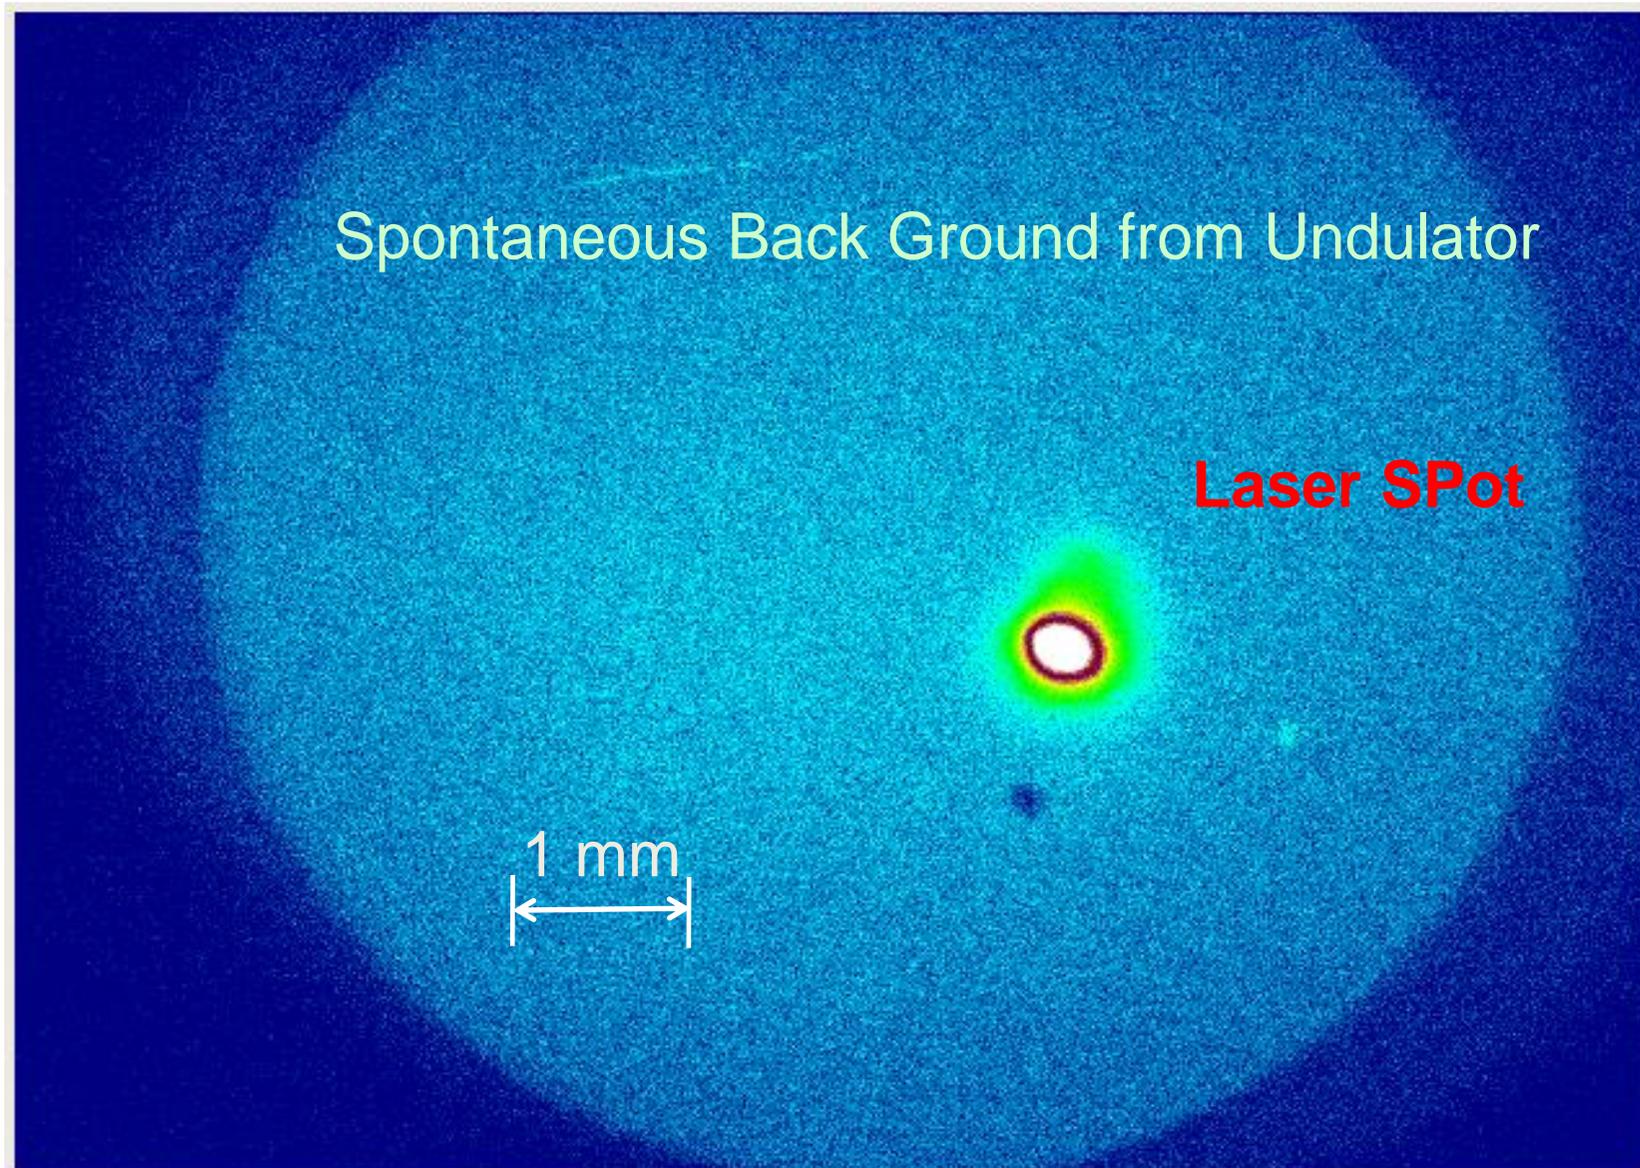

8 GeV, 400 m C-band Accelerator

Running at 35 MV/m in daily operation from March 2011 at 10 ~ 60 Hz.

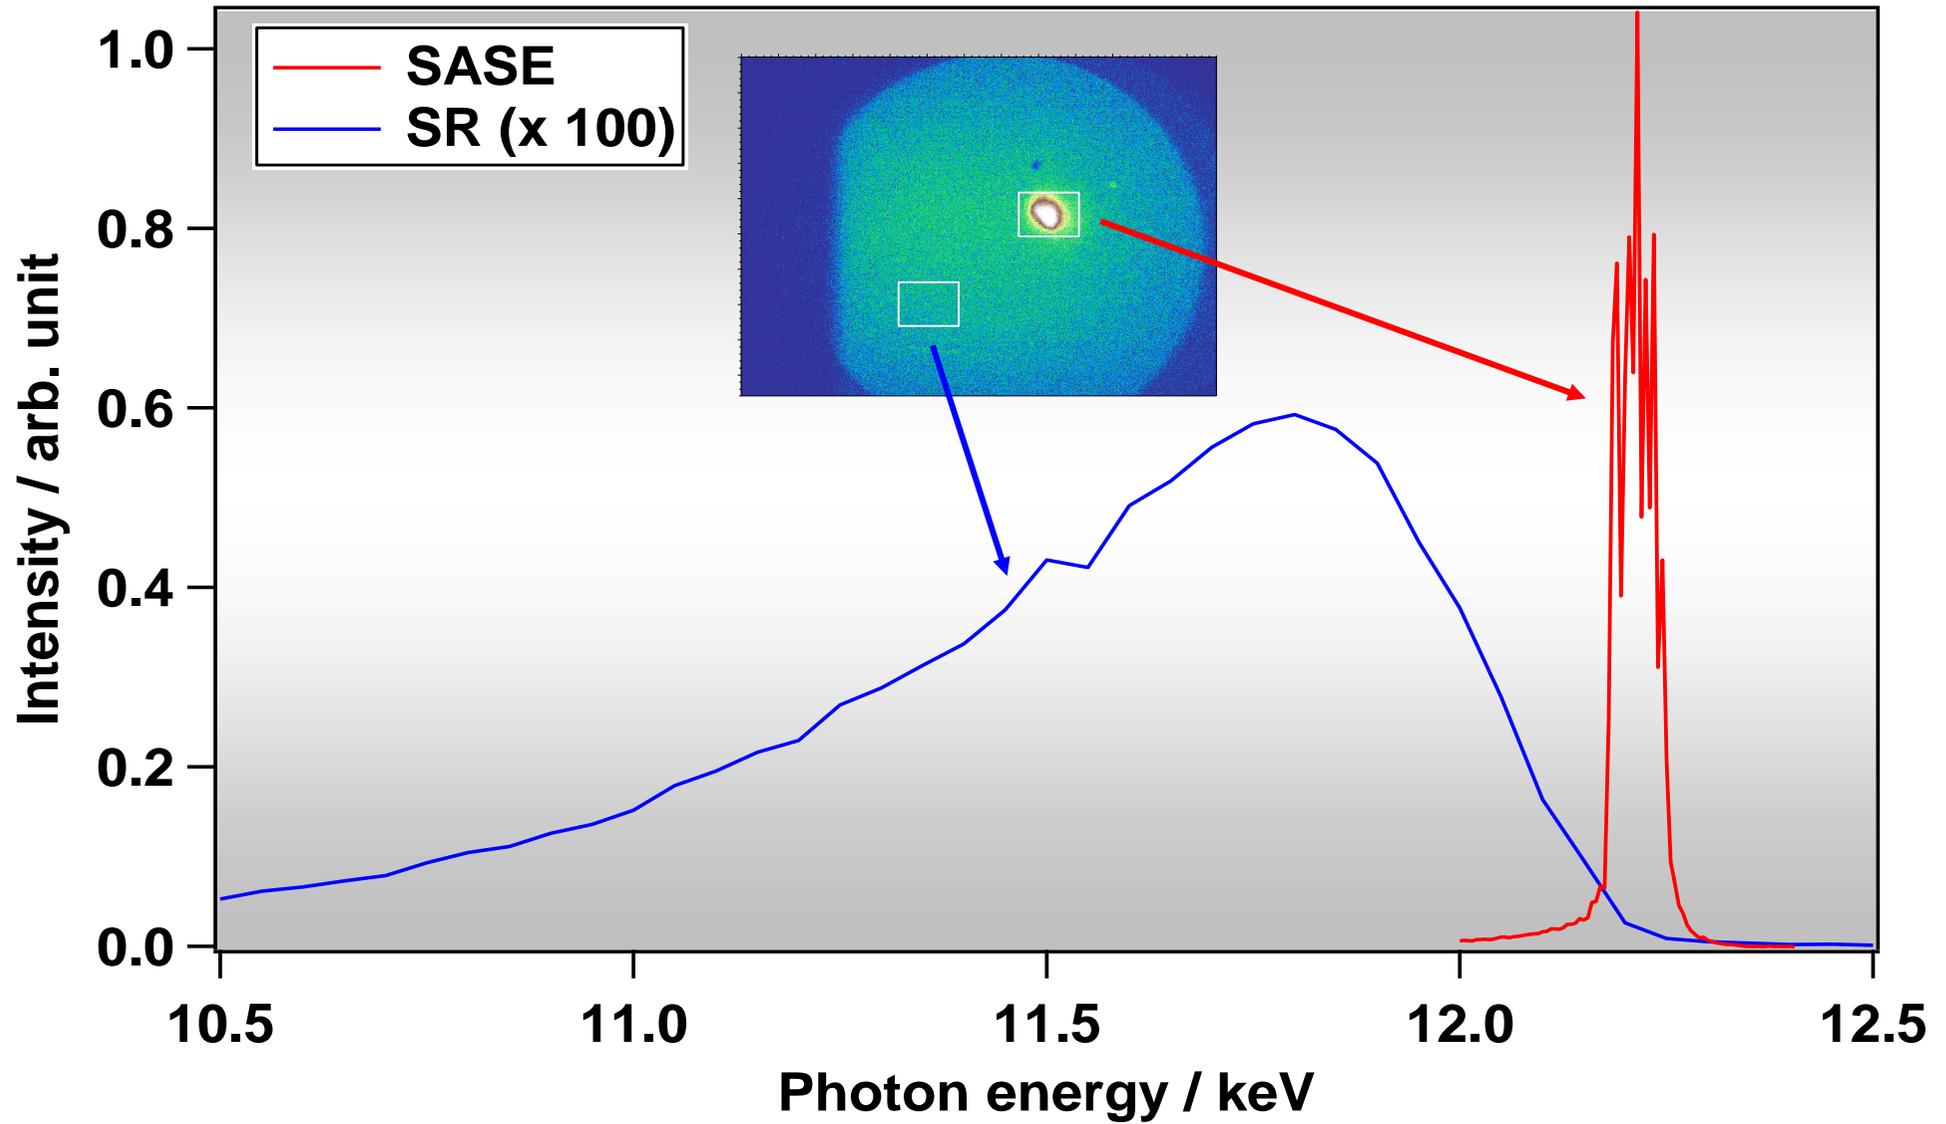

90 m long Undulator line. 18 unit of In-Vacuum Undulator. Variable-gap provides fast change of X-ray wavelength.

Spatial Profile (pointing is very stable)

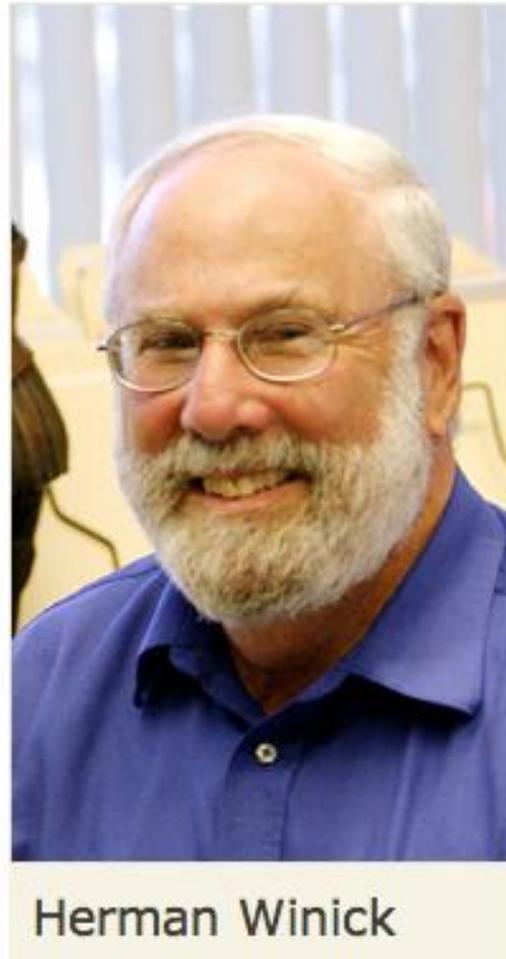

YAG-Screen 100 m downstream from undulator

Laser Spectrum(K=1.5)

Story started 1992

1992 Summer, at SLAC cafeteria, Prof. Herman Winick suggested me to join to the study group on X-ray Free Electron Laser: later it became LCLS.

“Yes, I will join, later, since I am now FFTB project”, I said.

I was at SLAC (1992-1995) as visiting researcher to serve international collaboration FFTB.

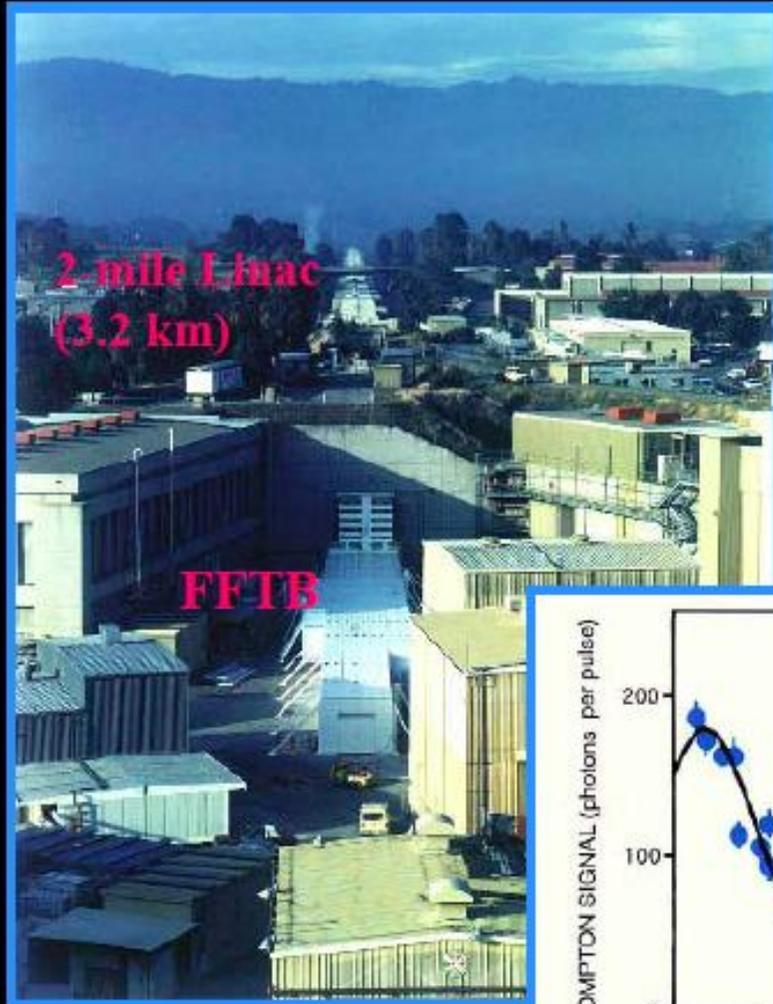

60 nm spot measurement
By laser interferometer and
Compton backscattering.

Tsumoru Shintake (KEK) (left) and David Burke (SLAC) in front of a spot size monitor. In May 1994, SLAC's FFTB generated the narrowest beam ever. Led by David Burke, groups from the Budker Institute, DESY, Fermilab, KEK, LAL, MPI Munich and SLAC worked together to produce a beam whose height was only one-tenth the wavelength of light. Their accomplishment proved that the large compression factors required for next-generation linear colliders are within reach.

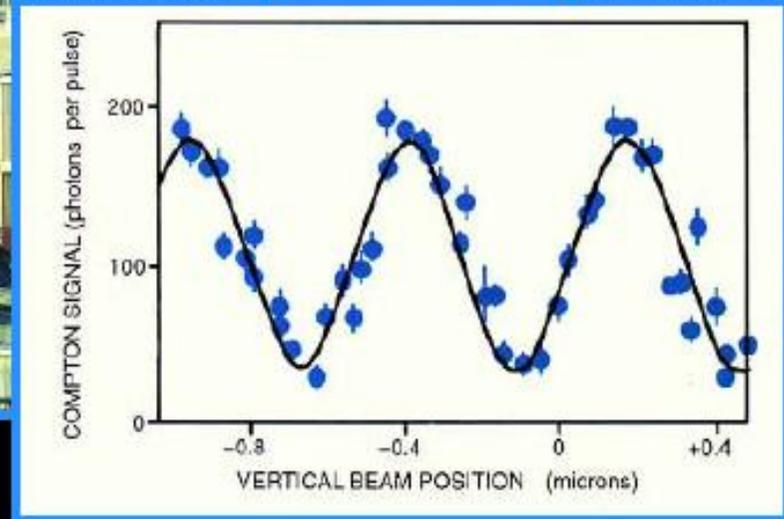

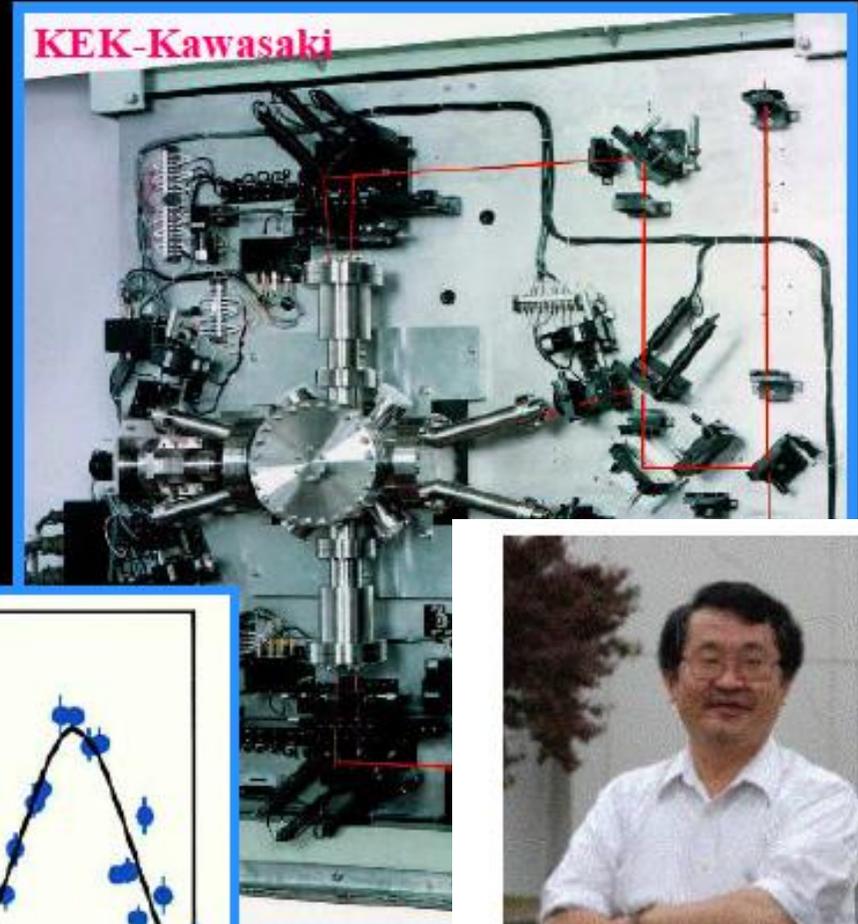

We proved 60 nm spot size creation using 50 GeV beam, which was key for e+e- linear collider design.

SLAC Two-mile Accelerator & FFTB

Laser Interferometer Table

Katsunobu Oide

~1995: We discussed lot on high gradient accelerator technology for LC.

Prof. Burton Richter

- While, SLAC was developing X-band technology.
- I proposed C-band for LC.
- *The reason is that “C-band(6GHz) is easier than X-band(11GHz), even S-band(3GHz) conventional, or L-band(1.3GHz) super conducting cavity”*

“You are wrong this time”, Burton said.

“But, I am sure C-band is the best”, I said.

Hiroataka Sugawara, former KEK director, decided to start C-band R&D at KEK from 1995.

"I am particle theorist, I do not know technology details, but I believe you, make it for us, for JLC"

...Hirotake said 1995.

C-band R&D 1995-2000: To show 35 MV/m acceleration at C-band.

C-band R&D

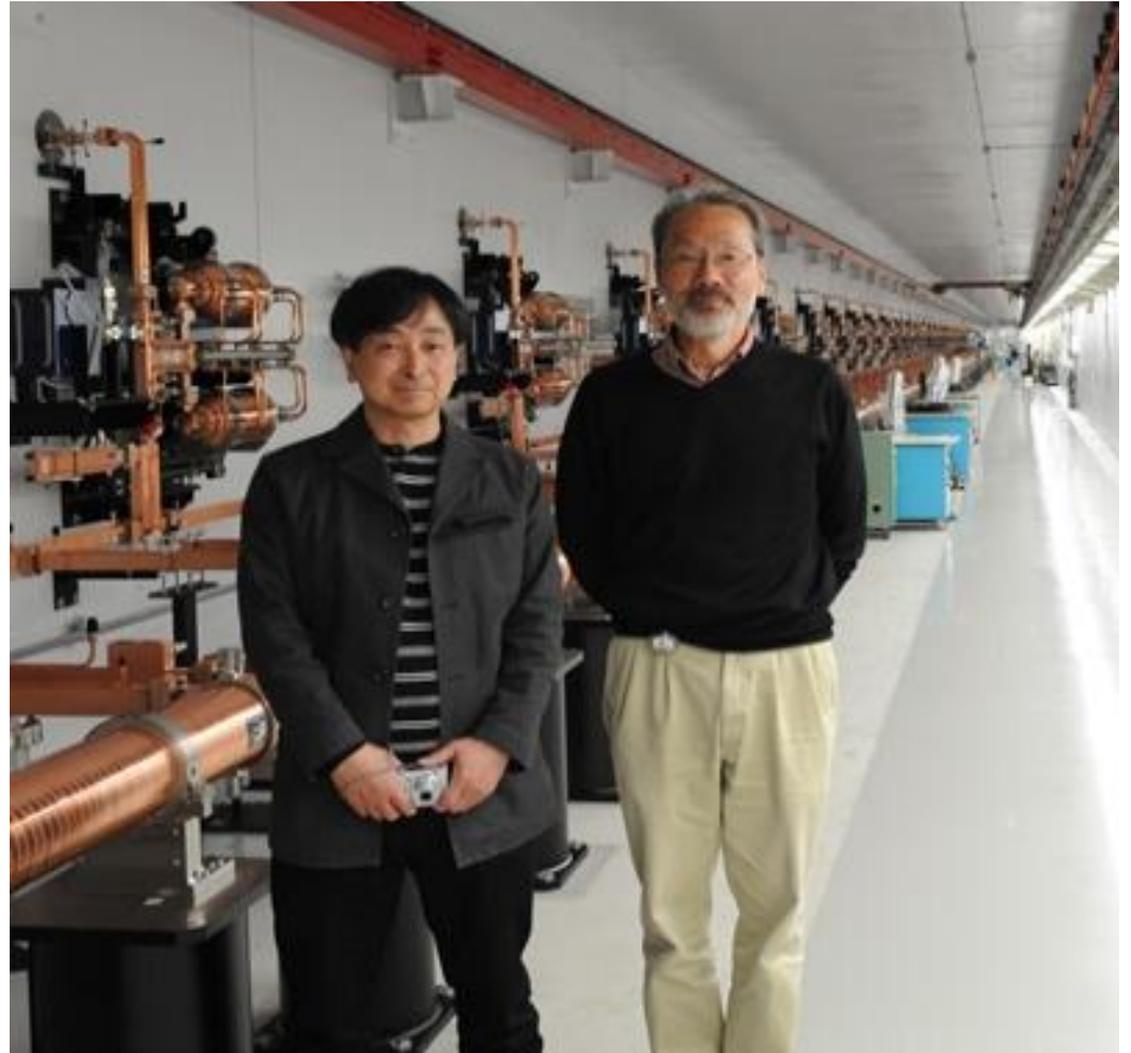

*C-band SAMURAI*s

Dr. Hiroshi Matsumoto contributed high power components R&D, for a long period.

**1996 at
KEK**

**2010 at
SACLA**

In klystron development at a new frequency, there is “**chicken or the egg causality dilemma**” on rf components. Especially the **rf-window**.

Photo credit: Visual Art Services

1995, Prof. G. A. Loew (former accelerator division director) gave an old C-band 5 MW klystron as a gift, which has been sleeping quite a long time at SLAC storage, it was originally used for RF particle separator R&D at CERN.

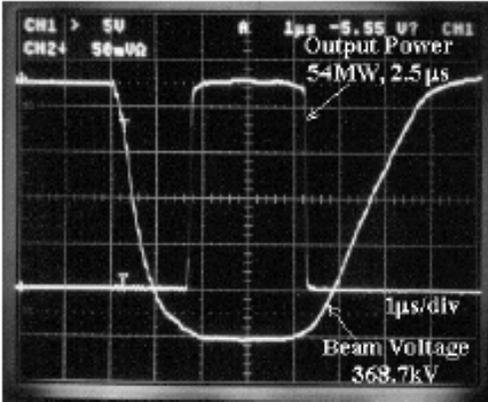

We quickly made resonant-ring test stand, which enhanced the rf power from 5 MW to 70 MW. Also, we used an modulator power supply from old medical accelerator to drive 5 MW klystron.

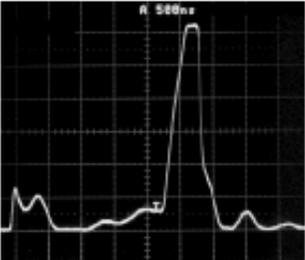

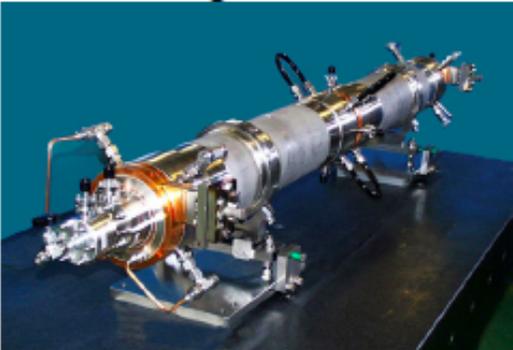

Using this, we tested our ceramic rf window: a key of 50 MW klystron.

C-band R&D 2000: Summary after 4 years work.

Table-1 : Results of Phase-I R&D and future task in Phase-II.

- Year of 2000, KEK stopped C-band R&D for JLC.
- Technical choice of ILC International Linear Collider merged to 1.3 GHz L-band Cold Technology.

We brought C-band to RIKEN/SPring-8 in 2000

Dr. Hideo Kitamura invited me to come RIKEN to continue C-band R&D and start FEL research.

Dr. H. Kamitsubo, former director of SPring-8, supported us to start FEL research.

Machining

Brazing of C-band Accelerators

- A number of technical improvements have been made.

- 1~2 columns per week.

Vacuum Brazing Furnace
at Mitsubishi Heavy Ind. in Mihara

Reliable High Power RF Acceleration System

- High power test on rf components is key to develop reliable system.
- Tested up to 40 MV/m.
- Careful installation into the tunnel.

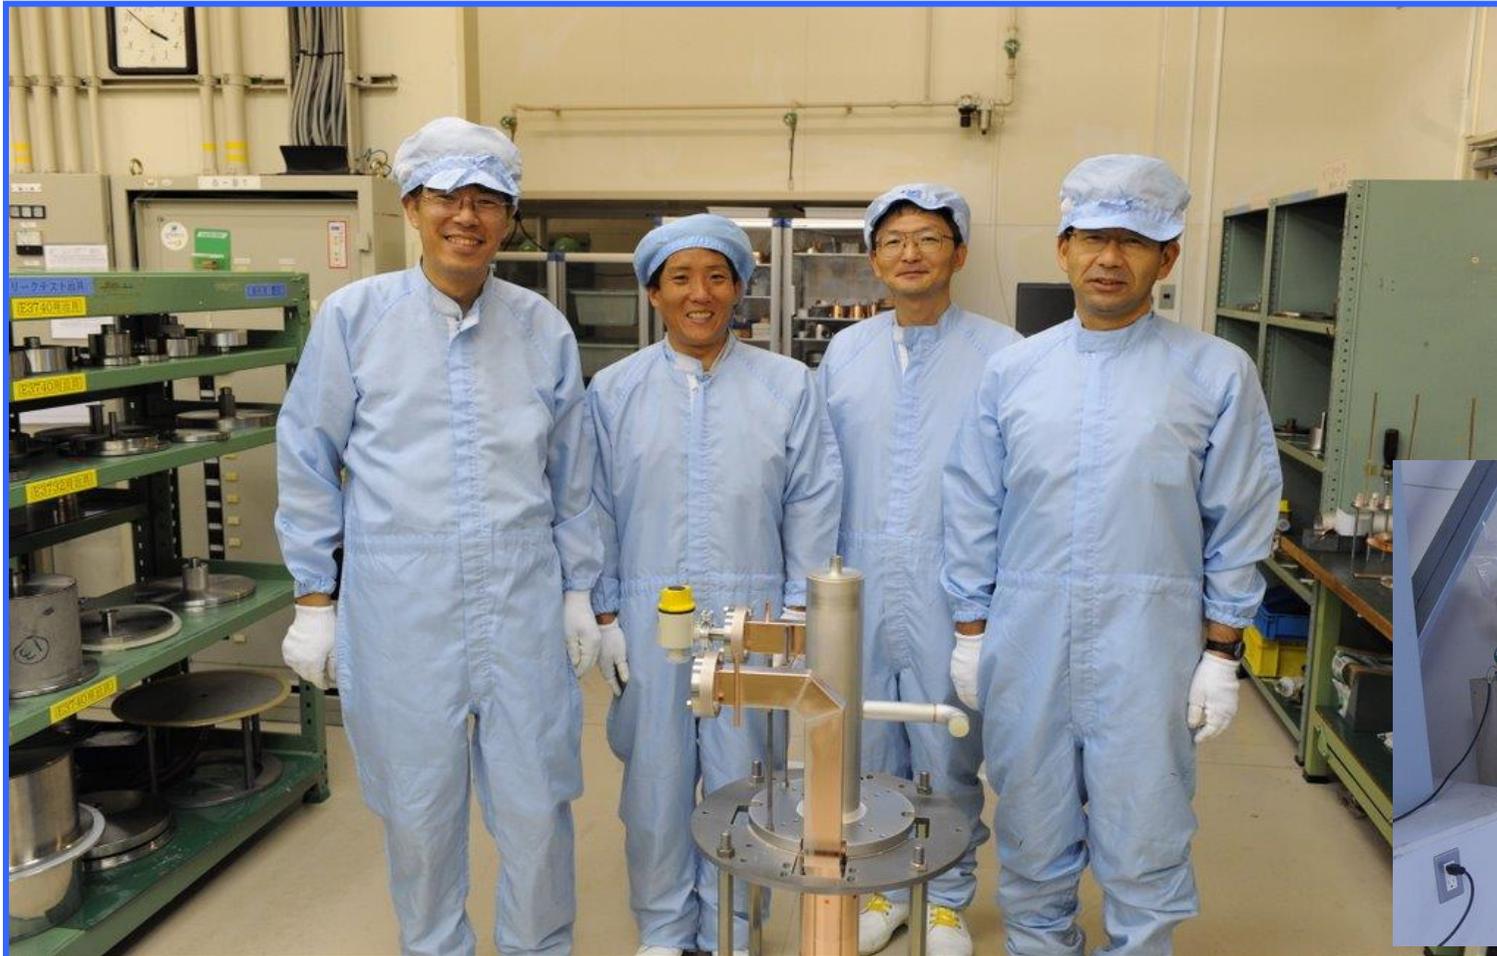

T. Sakurai and T. Inagaki

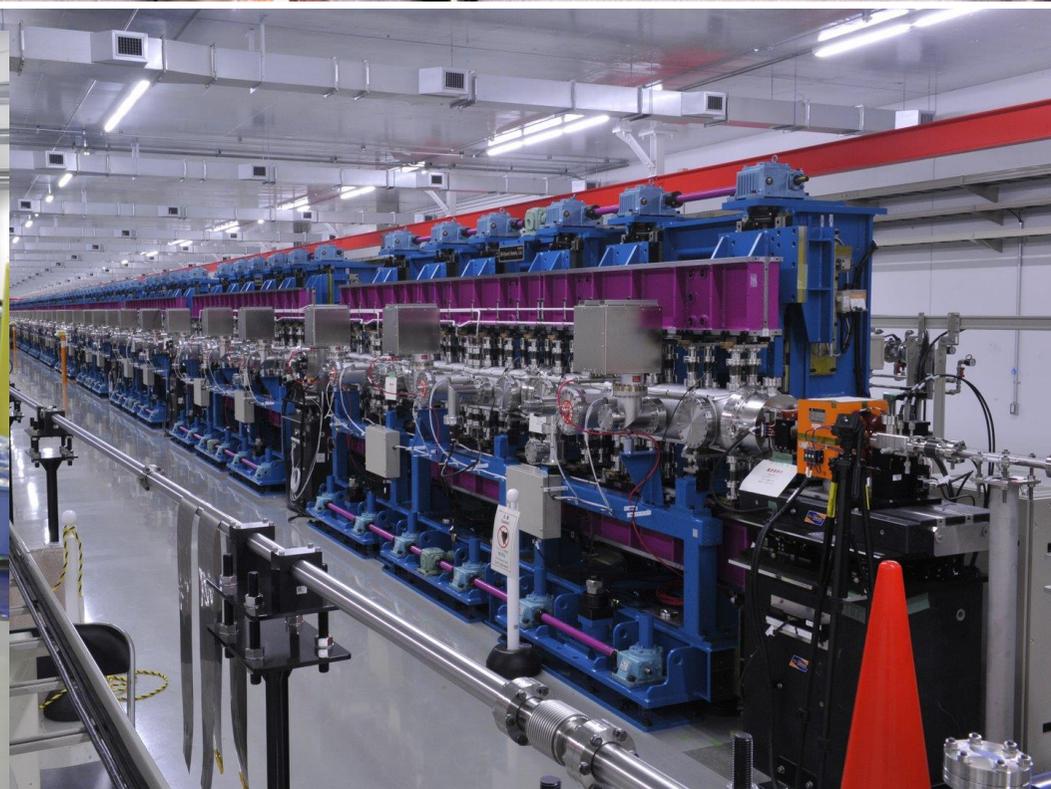

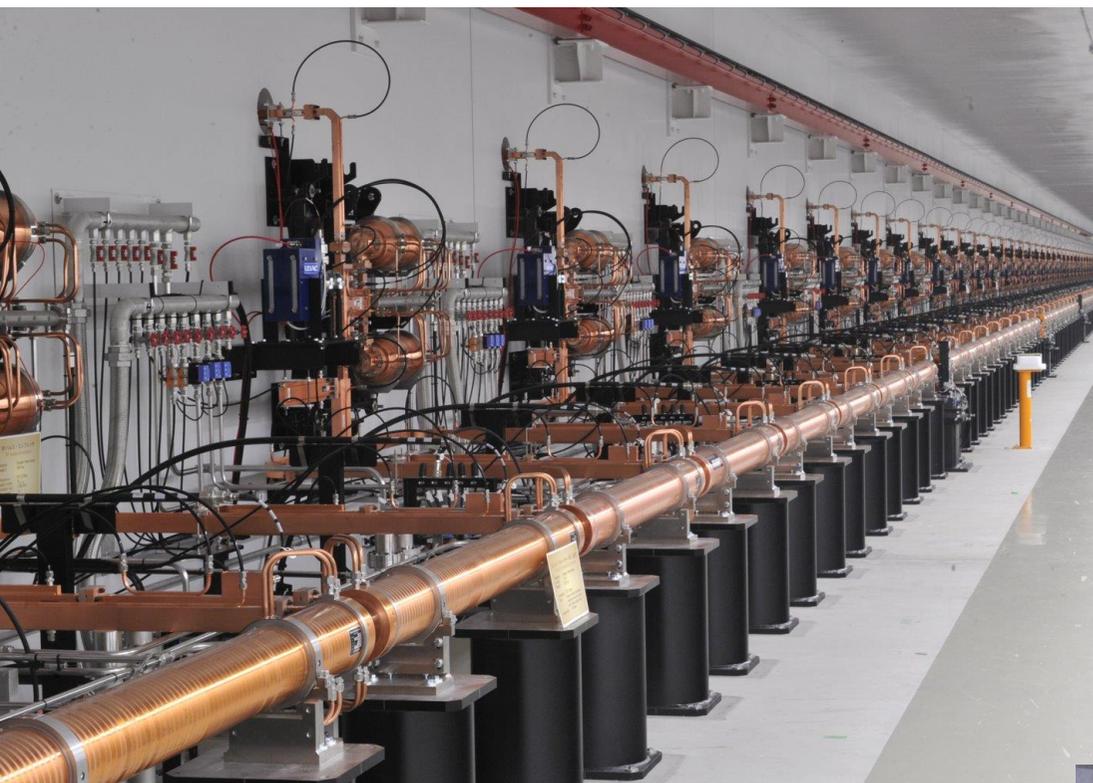

Mass Production of Klystrons at TOSHIBA

- 64 C-band klystron
- 4 S-band klystron
- 1 L-band klystron

C-band Klystron
5712 MHz, 50 MW
4 μ sec, 60 pps
45 % efficiency
Three-cell traveling wave output

Summary of SACLA Construction

- SACLA is working nicely, thanks to daily effort by operation team.
.....Status report will be presented by T. Hara.
- C-band at 35 MV/m acceleration voltage is reliable.
- CeB6 thermionic gun is providing stable beam, while we need to change cathode after ~10,000 hours operation.

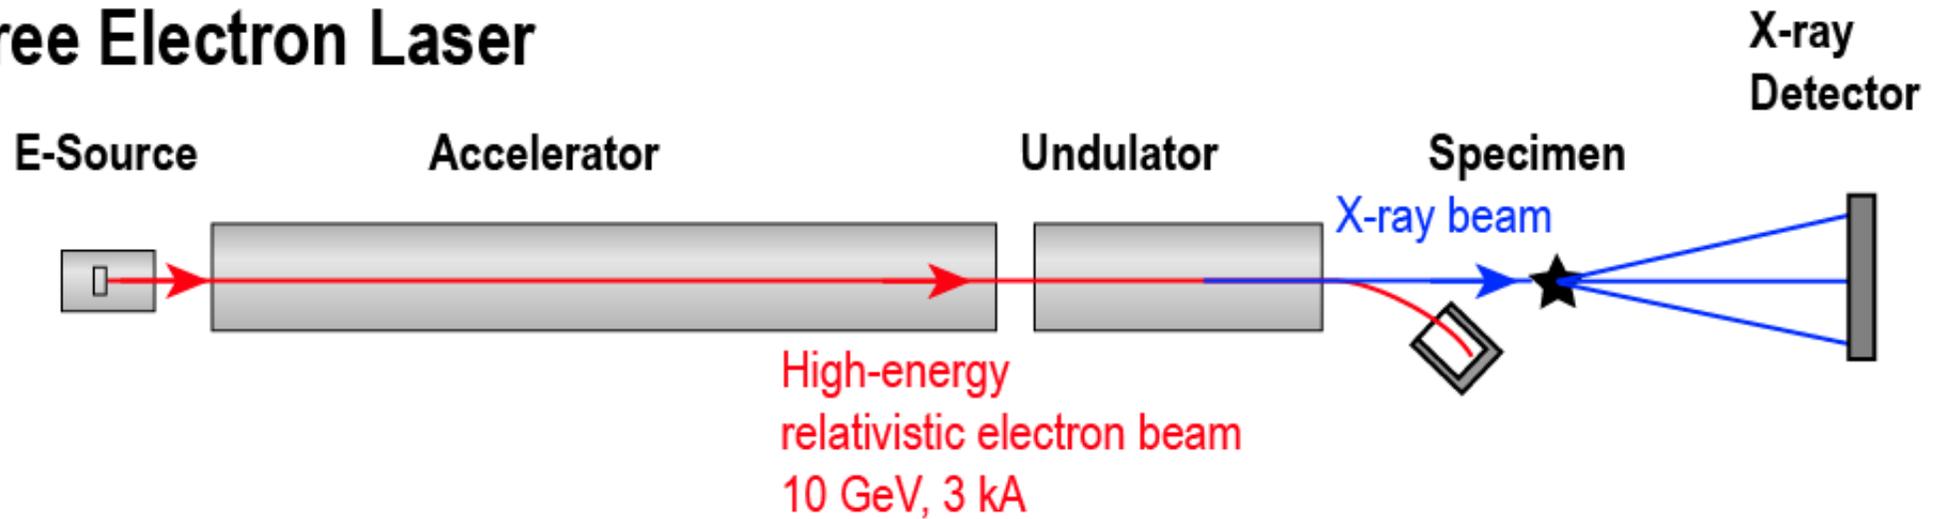

Future Perspective on X-ray Laser and Electron Microscopy based on High Performance Particle Beams

X-ray Interaction

Incident X-ray (~10 keV)

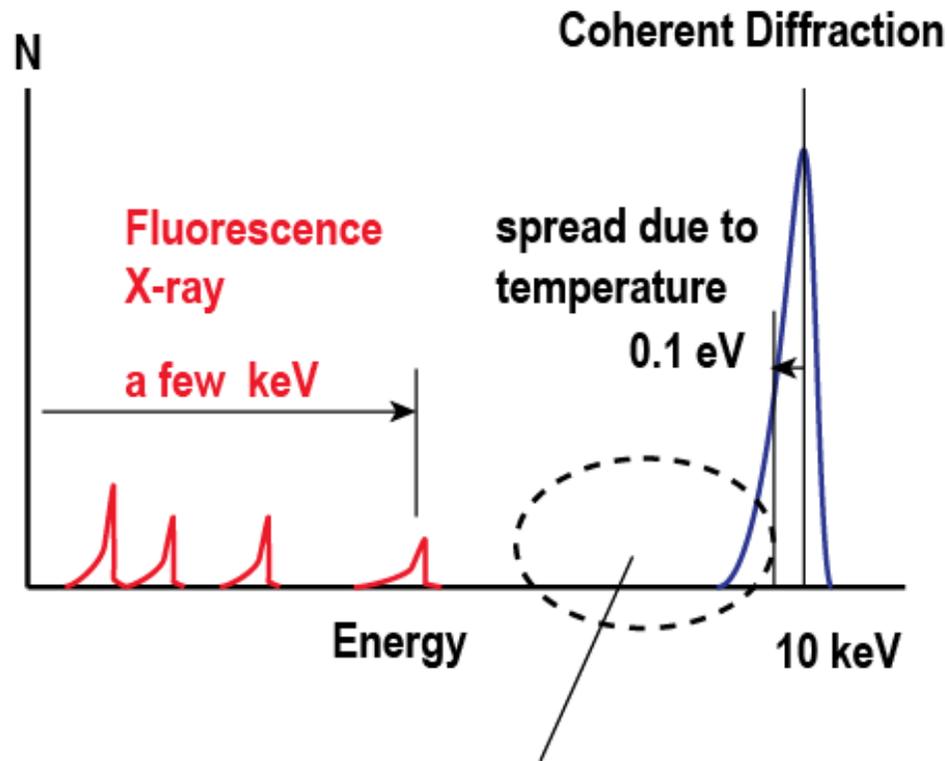

Electron Interaction

Incident High Energy Beam (100~300keV)

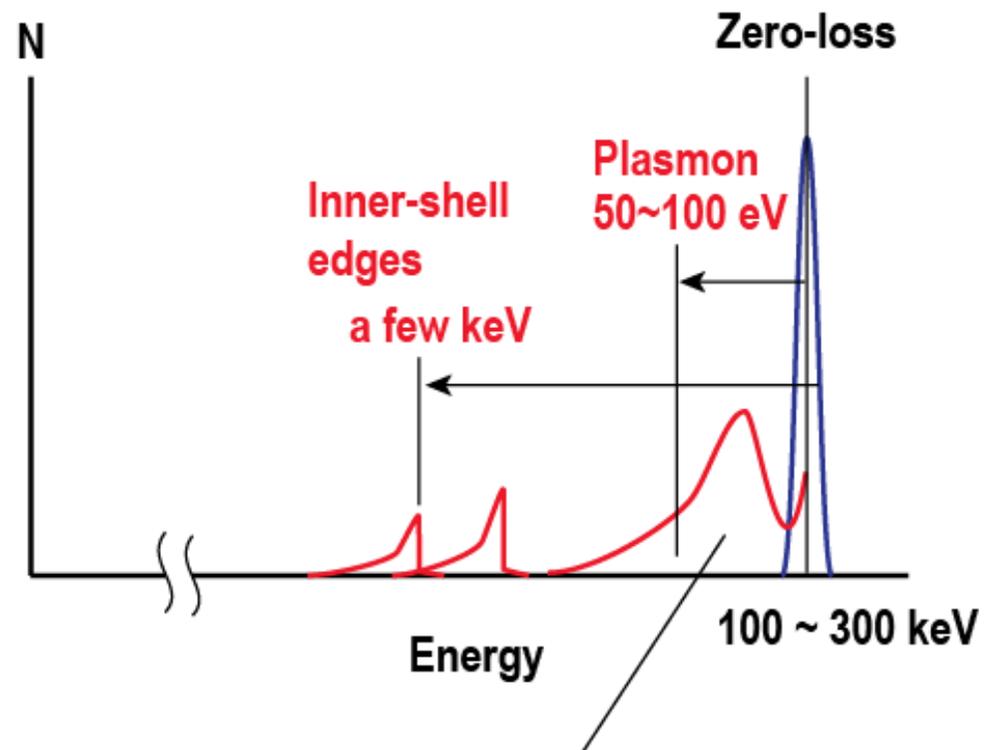

X-ray Interaction

There is no plasmon like energy loss because X-ray is charge-less and transferring energy is quantized at the photon energy (10keV). Therefore diffraction signal becomes very clean.

Electron Interaction

Plasmon excitation creates inelastic components, which closely mixed with zero-loss beam, which make EM imaging difficult and low contrast.

--> advanced energy filtering technology.

Ω -filter

What can we learn from EM?

- **FEL+EM:** Combination of EM and FEL will be good idea.
 - Identity sample quality before/at FEL experiment.
 - Jet injection +FEL followed by gas deposition on graphene +SEM
- **FEL → EM**
RF-Gun will makes Femto-TEM possible. Plasmon excitation becomes larger as higher electron density.
- **EM → FEL**
Environmental FEL will be important.
- **FIB → FEL**
FIB + FEL, sample milling in-situ, making S/N better.
About FIB, visit such as SII corp.

FEL has various potential applications, and we need more FELs..

- Because interaction of X-ray with matter is rather simple, and provides cleaner signal → imaging, spectroscopy
- X-ray is charge less: Bose particle, thus infinitely intense beam can be formed in principle. → new physics
- Femto-second pulse form is very unique. → mode locking, pump-probe
- Polarization control will provide another channel.

For young students, you have more chance in FEL community.
