

**Linac Injector for SOLEIL\***, R. CHAPUT,  
J. LESREL, M.-A. TORDEUX, LURE, Centre  
Universitaire, Bat. 209D, 91405 Orsay Cedex, France -  
The synchrotron light ring SOLEIL is fed from a linac  
followed by a booster at 2.15 GeV with electrons or  
positrons. The ring commissioning will begin with  
electrons and the first results will show if we need  
positrons to get a good beam lifetime. The design of a  
positron and electron linac must be compatible with  
positron option if required. The two linac options,  
200 MeV electron or 350 MeV positron are presented.
