# Outline

## §1 Motivation & Concept of the scheme

- ⇒ For single-pass high-gain FEL amplifier, impact on the beam can be abrupt and violent, compared to relatively mild process for low-gain FEL
- ⇒ Possible reuse of the electron beam

## §2 Model description

- ⇒ Modified 1-D FELO model

## §3 Simulation results

- ⇒ Preliminary feasibility study
- ⇒ Ignore practical technical challenges

## §4 Summary & Discussion

### §0 Outline

### §1 Introduction

### §2 Model description

### §3 Main results

### §4 Summary & Discussion

# Motivation

- High-brightness FEL/e-beam is very expensive
- Low-repetition-rate FEL facilities can only support one or few experiment stations
- High-repetition-rate high-gain FEL is presently a hot and active topic, initiate many ongoing projects, and can potentially support more experiment stations
- Simultaneous, in-parallel operation of multiple undulator lines may compromise the repetition rate
- For single-pass high-gain FEL amplifier, impact on the beam can be abrupt and violent, compared to relatively mild process for low-gain FEL
- Idea: High-repetition-rate e-beam to drive low-gain FELs, in-serial operation

§1 Introduction

§2 Model description

§3 Main results

§4 Summary & Discussion

# 1-D FEL model

$$\begin{cases} \frac{d\theta_j}{d\tau} = p_j, & \frac{dp_j}{d\tau} = - \left( A e^{i\theta_j} + A^* e^{-i\theta_j} \right) \\ \frac{dA}{d\tau} = \langle e^{-i\theta_j} \rangle + i\delta A \end{cases}$$

Scaled gain parameter  $G \equiv 4\pi\rho N_u \Rightarrow \begin{cases} G > 1 & \text{high-gain} \\ G < 1 & \text{low-gain} \end{cases}$

Intensity gain per pass  $\mathcal{G} \equiv \frac{|A_G|^2 - |A_0|^2}{|A_0|^2}$

where  $A_G = A(\tau = G)$ ,  $A_0 = A(\tau = 0)$

Radiation output power  $P_{\text{out}} = \rho |A|^2 P_b \frac{\alpha}{\mathcal{L}}$

where  $\mathcal{L} = \alpha + (1 - R)$ , with the reflectivity  $R$  and  $\alpha$  the outcoupling ratio<sup>3</sup>

§0 Outline

§1 Introduction

§2 Model description

§3 Main results

§4 Summary & Discussion

<sup>3</sup>B.W.J. McNeil et al., FEL2006 (MOPPH011).

After leaving the oscillator #1 and serving the oscillator #2

$$\theta_j \rightarrow \theta_j + k_{R_{56}} \rho_1 p_j$$

with  $k_{R_{56}} = 2\pi R_{56} / \lambda_r$ . For simplicity, consider isochronous transport  $k_{R_{56}} = 0$ . Oscillator radiation fields develop by the following iteration

$$A_{i,0}^{(n+1)} = r_i A_{i,G}^{(n)}, \quad r_i = \sqrt{R_i}, \quad i = 1, 2$$

For oscillator #2, the e-beam quality degradation is reflected on Pierce parameter  $\rho \rightarrow \rho_{\text{eff}} = \rho (F_{\text{inh}} F_f)^{\frac{1}{3}}$ , taking into account energy spread increase. For oscillator #2,  $\rho_{\text{eff}}$  is updated every pass, and phase space coordinates re-scaled

$$\begin{cases} \theta_j (\tau_2 = 0) = \theta_j (\tau_1 = G_1) + k_{R_{56}} \rho_{\text{eff},1} p_j (\tau_1 = G_1) \\ p_j (\tau_2 = 0) = \left( \frac{\rho_{\text{eff},1}}{\rho_{\text{eff},2}} \right) p_j (\tau_1 = G_1) \end{cases}$$

# Numerical example<sup>4</sup>

Name	Value	Unit
Resonant electron energy $E = \gamma_r mc^2$	5.7	GeV
Bunch length, rms $\sigma_t$	0.55	ps
Bunch charge	380	pC
Bunch current $I_b$	300	A
Normalized emittance $\epsilon_{nx}$	0.3	$\mu\text{m}$
Energy spread $\sigma_\delta$	$0.3 \times 10^{-4}$	
Undulator period $\lambda_u$	1.88	cm
Number of undulator periods $N_{u1}, N_{u2}$	100/68	
Undulator parameter $K$	1.5	
Resonant wavelength $\lambda_r$	1.6	$\text{\AA}$
Round-trip reflectivity $R$	0.8	
Outcoupling ratio $\alpha$	0.04

§0 Outline

§1 Introduction

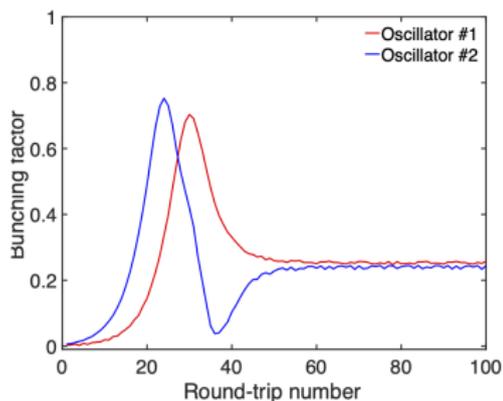

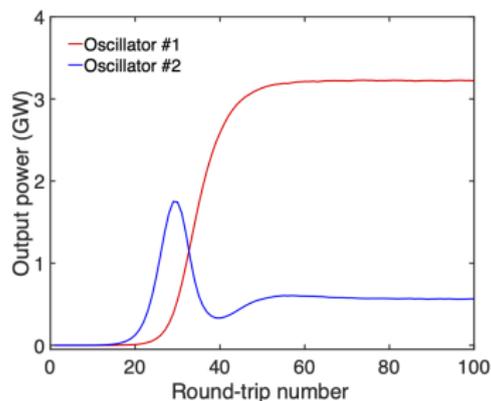

§2 Model description

§3 Main results

§4 Summary &amp; Discussion

- Parameters only for illustration purpose, not optimized
- Injected 5.7-GeV beam may come from CEBAF after 2.5 passes
- Oscillator #2 has smaller number of undulator periods because driving electron beam is already microbunched
- Relatively short undulator length  $\leq 2$  m, compared to common XFEL designs  $\geq 50$  m
- Relatively lower single-pass gain can be compensated by a larger bunch charge
- Single-pass gain cannot be too small to compensate round-trip loss; cannot be too large to avoid early saturation
- Reflection & focusing: three high-reflectivity Bragg mirrors, two CRL, and one 4% outcoupling  
 $\Rightarrow R \approx 0.96^3 \times 0.997^2 \times 0.92 \approx 0.8$
- Initial detune for two oscillators:  $p_0 = \delta \approx 2.6/G_{1,2}$ , where  $G_{1,2} = 4\pi\rho_{1,2}N_{u1,u2}$  (not optimized for #2)

# Evolution of output power and bunching factor

The output power of oscillator #1 is consistent with the rough estimate formula<sup>5</sup>  $P_{\text{sat}} \approx \frac{\alpha P_{\text{beam}}}{N_u(1-R)} \approx 3.4 \text{ GW}$ . Scaled gain parameters  $G_{\#1} \approx 1.42$ ,  $G_{\#2} \approx 0.96$ . Initial Pierce parameter  $\rho_{\text{eff}} \approx 1.126 \times 10^{-3}$ . For simplicity,  $kR_{56} = 0$

§1 Introduction

§2 Model description

§3 Main results

§4 Summary & Discussion

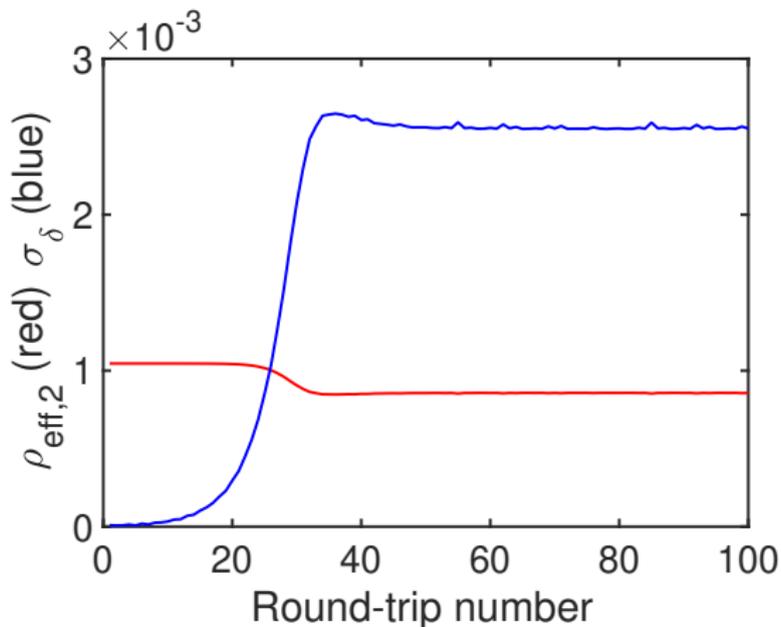

Figure: Beam energy spread and Pierce parameter at the entrance of oscillator #2.

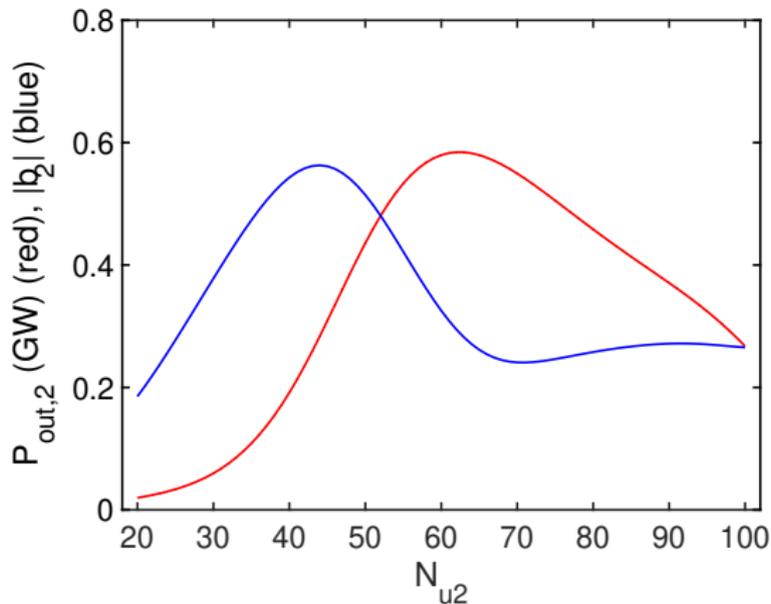

§0 Outline

§1 Introduction

§2 Model description

§3 Main results

§4 Summary & Discussion

**Figure:** Output power and bunching factor of oscillator #2 as a function of  $N_{u2}$ . For oscillator #2 the radiation field can well incubate at  $N_{u2} = 68$ . As a reference, the oscillator #1 output power is 3.22 GW and the exit bunching factor is approximately 0.24.

# Summary & Discussion

- Investigated the feasibility of using the same electron beam to drive two XFELs by the modified 1-D FEL model. More detailed, 3-D time-dependent simulation ongoing
- Assume a CEBAF-like e-beam with 5.7 GeV and peak current 300 A, simulated output powers of approximately 3.2 GW and 0.6 GW, peak brightnesses of  $\sim 10^{32\sim 31}$  and average brightnesses of  $\sim 10^{27\sim 26}$  photons/sec/(mm mr)<sup>2</sup> × (0.1% BW), assuming a repetition rate of  $\sim 0.5$  MHz
- Concept may enable a potential, economic application using a circulator ring such that an oscillator can be driven alternately by fresh linac bunches or from used bunches, while providing competent peak and average brightness
