CONSYS - A NEW HIGHLY OBJECT ORIENTED CONTROL SYSTEM.

J.S. Nielsen, Isa; K.T. Nielsen, Isa; T. Worm, Isa

The ConSys control system is developed for control of the storage ring facilities at ISA. A strong object-oriented approach has been used resulting in a highly flexible and modular design, where front-end and client computers have identical core software. All machine dependent information is stored in a database. The result is a site and machine independent system that is easy to maintain. The control system is implemented on PC´s running Windows NT.
