Outline

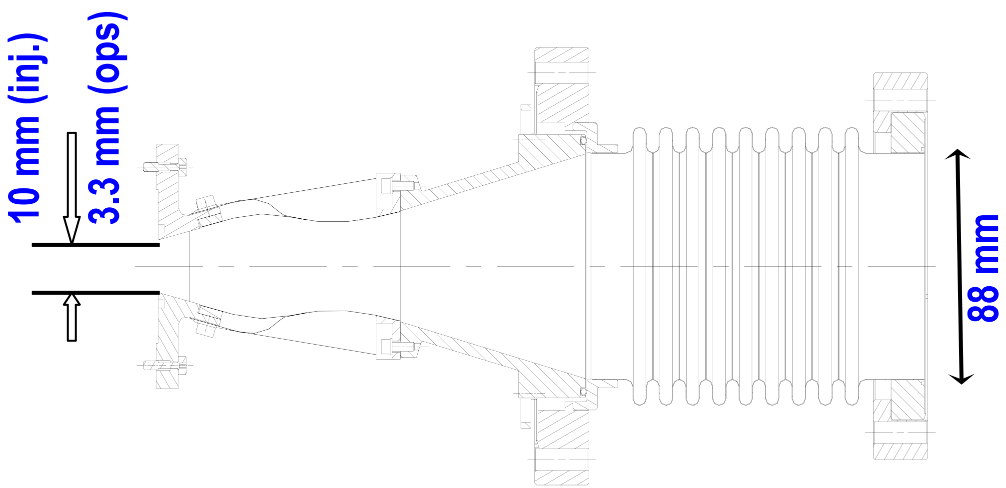
- Motivation
- Review of theoretical results
- Optimal boundary
- EM solvers used
- Results for impedance reduction
- Conclusion

Z-optimization by non-linear tapering is not that new ….

Apart from acoustics, used for gyrotron tapers, mode converters, antennae design, etc.

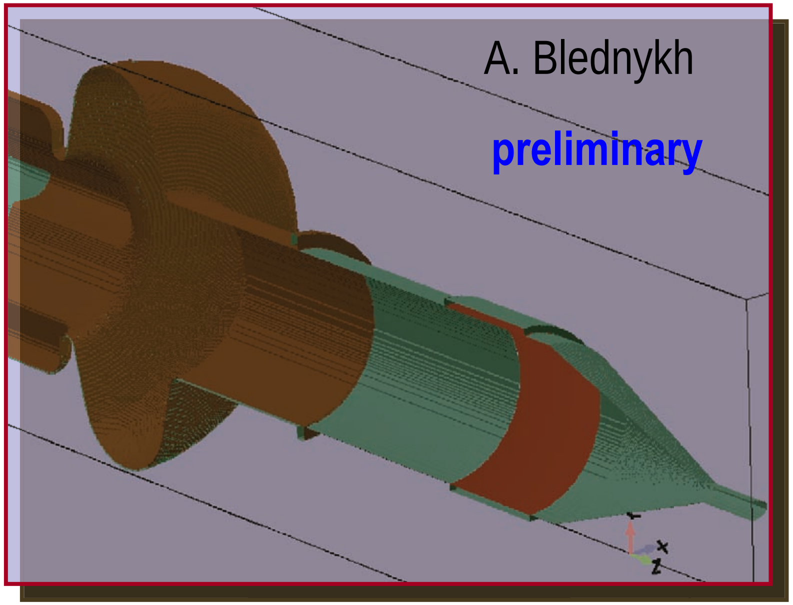
Examples of Accelerator Tapers & Motivation and Scope of This Work

NSLS MGU Taper for X13, X25, X29 & X9



h_{max}/h_{min}~ 9 (gap open) or 27 (gap closed)

NSLS-II transition to SC RF cavity



h_{max}/h_{min}~10

Focus on large X-sectional variations and gradual tapering; study transverse, broad-band geometric impedance @ low frequency inductive regime

Goal to reduce Z to avoid instabilities (TMCI) in rings, or ε degradation in linacs ...

Theory Review

Axially symmetric taper

$$Z_{\perp}(k) \cong -\frac{iZ_0}{2\pi}\int_{-\infty}^{\infty} dz \frac{r'(z)^2}{r(z)^2}$$

K. Yokoya, 1990

Flat rectangular taper 2*w* × 2*h*, *w*>>*h*

$$Z_y^{rect}(k) = -\frac{iZ_0 w}{4}\int_{-\infty}^{\infty} dz \frac{h'(z)^2}{h(z)^3}$$

G. Stupakov, 1995

Elliptical x-section taper 2*w* × 2*h* , *w*>>*h*

$$Z_x^{ell}(k) = -\frac{iZ_0}{4\pi}\int_{-\infty}^{\infty} dz \frac{h'(z)^2}{h(z)^2}$$

$$Z_y^{ell}(k) = -\frac{iZ_0 \pi w}{16}\int_{-\infty}^{\infty} dz \frac{h'(z)^2}{h(z)^3}$$

Z_x: $h << L$, $k <\sim 1/h_{min}$

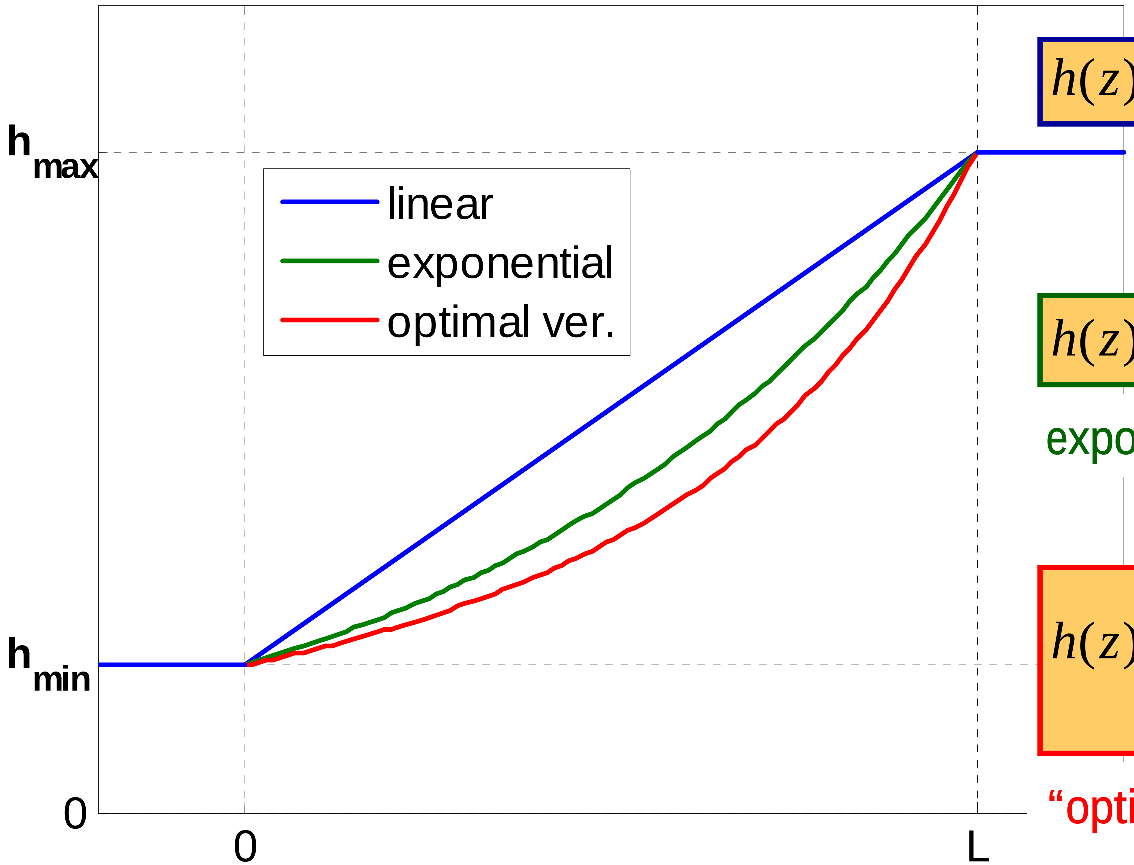
Z_y: $w << L$, $k <\sim 2/w_{min}$

B. Podobedov & S. Krinsky, 2006

These are inductive regime impedances. Tapers are gradual to be effective.

Functionals lend themselves to simple boundary optimization.

Optimizing boundaries



$$h(z) = h_{min}(1 + (h_{max}/h_{min} - 1) \times z/L)$$

linear

$$h(z) = h_{min}(h_{max}/h_{min})^{z/L}$$

exponential to minimize Z_x (or $Z_\perp$ *h*->*r*)

$$h(z) = \frac{h_{min}}{\left(1 + ((h_{min}/h_{max})^{1/2} - 1)\, z/L\right)^2}$$

"optimal vertical" to minimize Z_y

Reduced slope @ small *h*(z); big difference when $h_{max}/h_{min} >> 1$

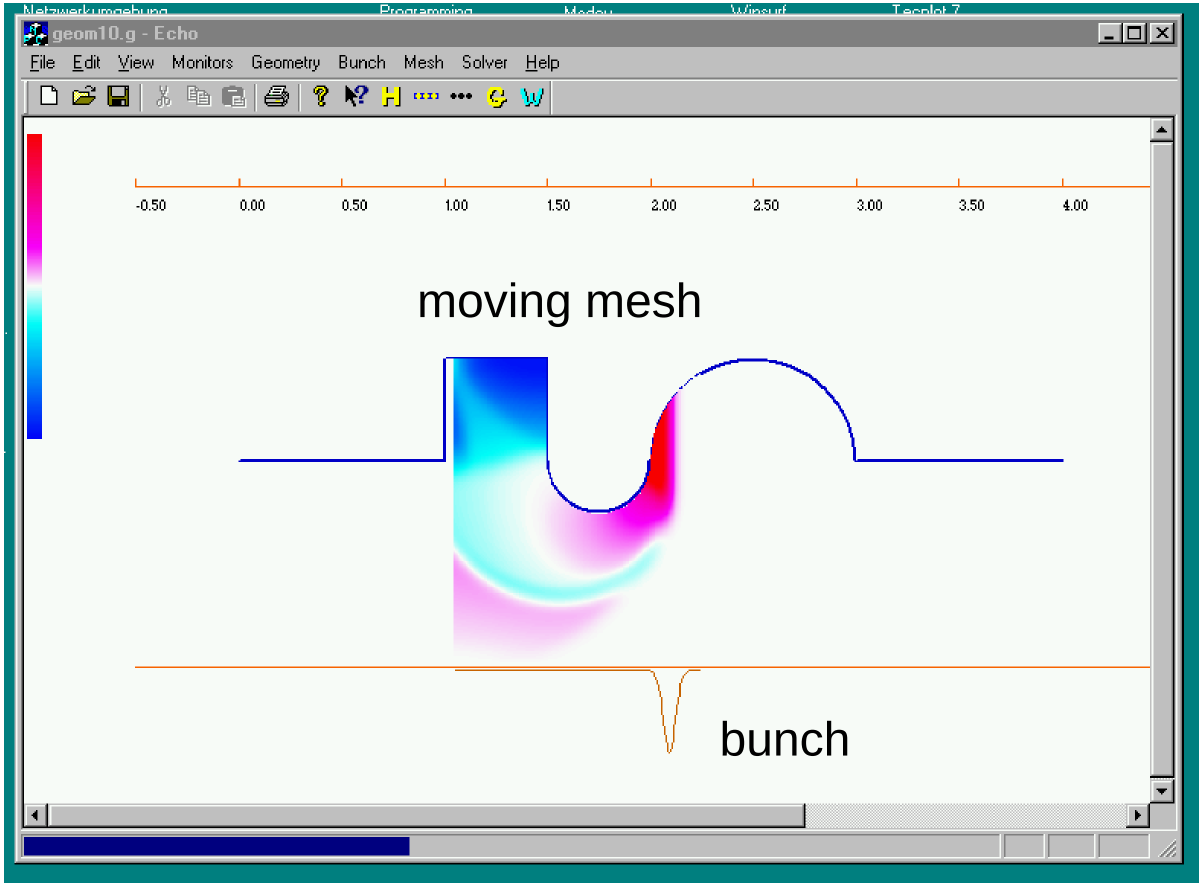
At $h_{max}/h_{min} = 20$ predict factor of 2 reduction for $Z_\perp$ or Z_x, factor of ~3 for Z_y

What Was Done

We attempted to check the accuracy of theoretical predictions for impedance reduction by non-linear tapers in axially-symmetric, elliptical, and rectangular geometry using EM field solvers

- ABCI (axially symmetric)
- ECHO (axially symmetric & 3D)
- GDFIDL (3D)

Wakefield code ECHO
(TU Darmstadt / DESY)



Electromagnetic

Handling
Of
Harmful
Collective
Effects

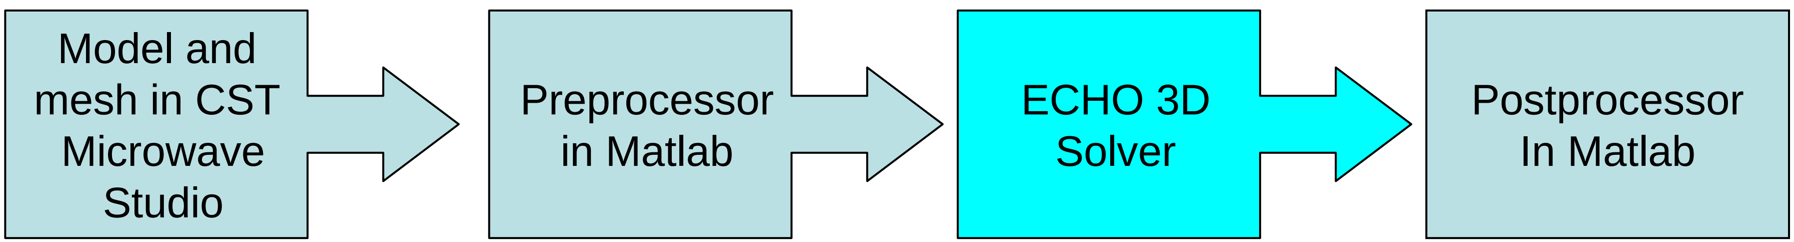
Zagorodnov I, Weiland T., *TE/TM Field Solver for Particle Beam Simulations without Numerical Cherenkov Radiation*// Physical Review – STAB,8, **2005**.

Wakefield code ECHO
(TU Darmstadt / DESY)

- **zero dispersion** in z-direction
- **staircase free** (second order convergent)

} accurate results with coarse mesh

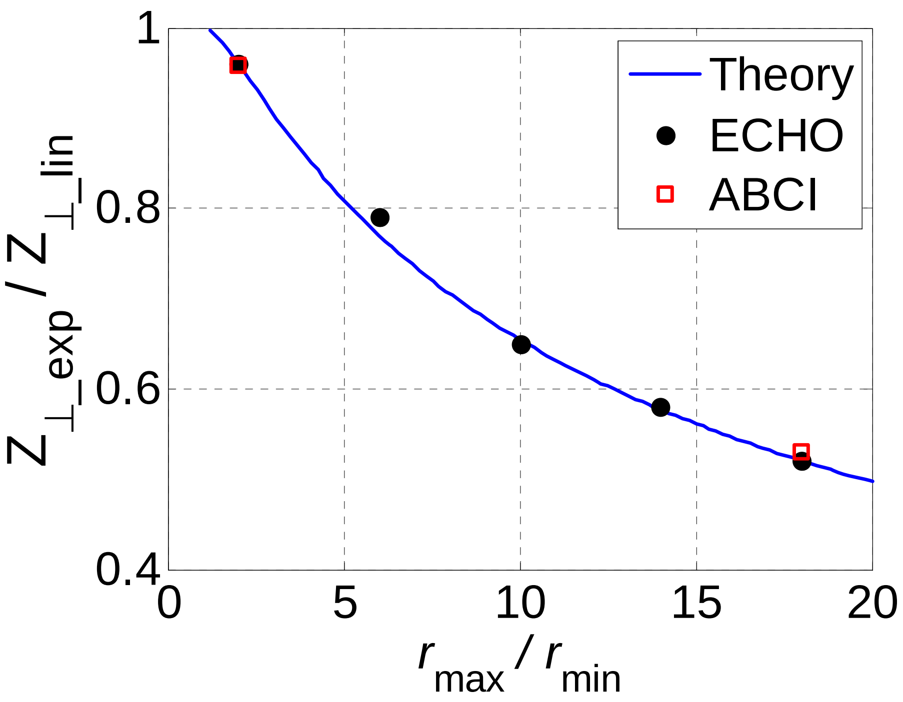
- **moving mesh** without interpolation
- in **2.5D** stand alone application



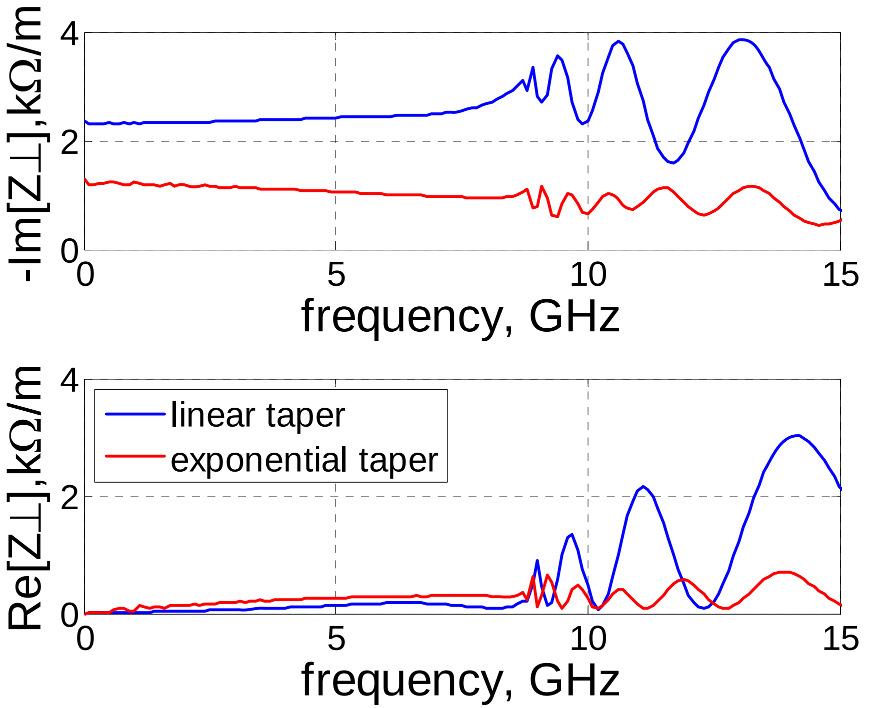
- in **3D** only solver, modelling and meshing in CST Microwave Studio
- allows for accurate calculations on conventional single-processor PC
- To be parallelized ...

Impedance Reduction for Axially Symmetric Tapers

$Z_\perp$ reduction for exponential tapering



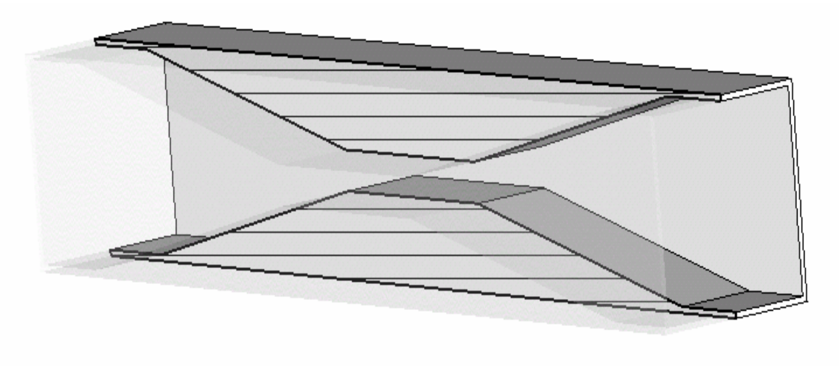
$Z_\perp(f)$ for r_{max}/r_{min}= 18, r_{min} =1 cm



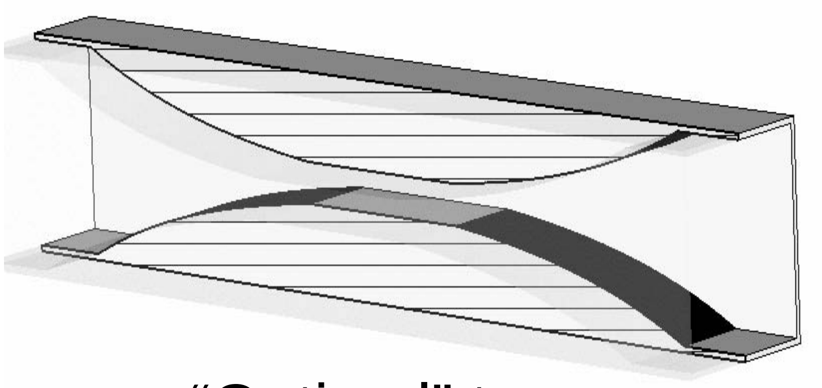
$Z_\perp$[kΩ/m] and reduction due to exponential taper agree well with theory

Impedance reduction extends through inductive regime (k~$1/r_{min}$) & beyond

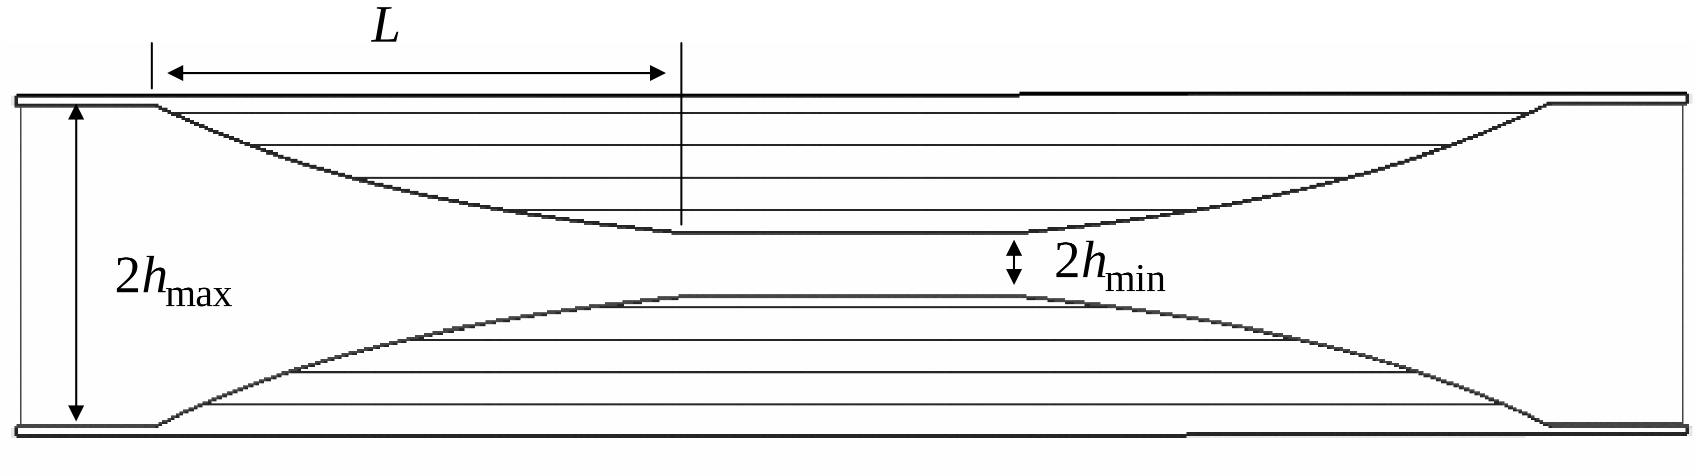
Geometry for Rectangular Taper Calculations



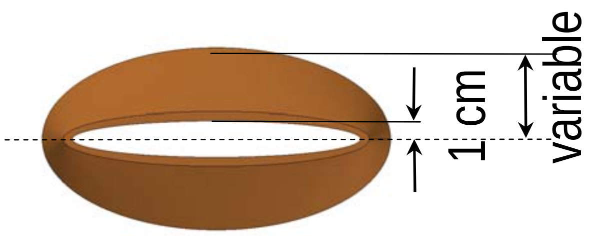
Linear taper



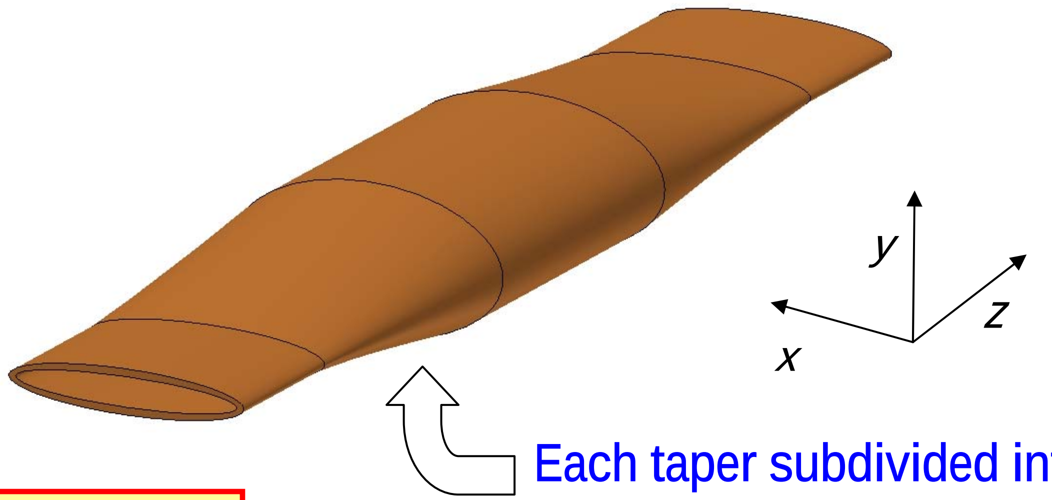
“Optimal” taper



Geometry for Elliptical Taper Calculations



confocal geometry $w(z)^2$-$h(z)^2$=const.



4:1 or 8:1 aspect ratio
@ min X-section

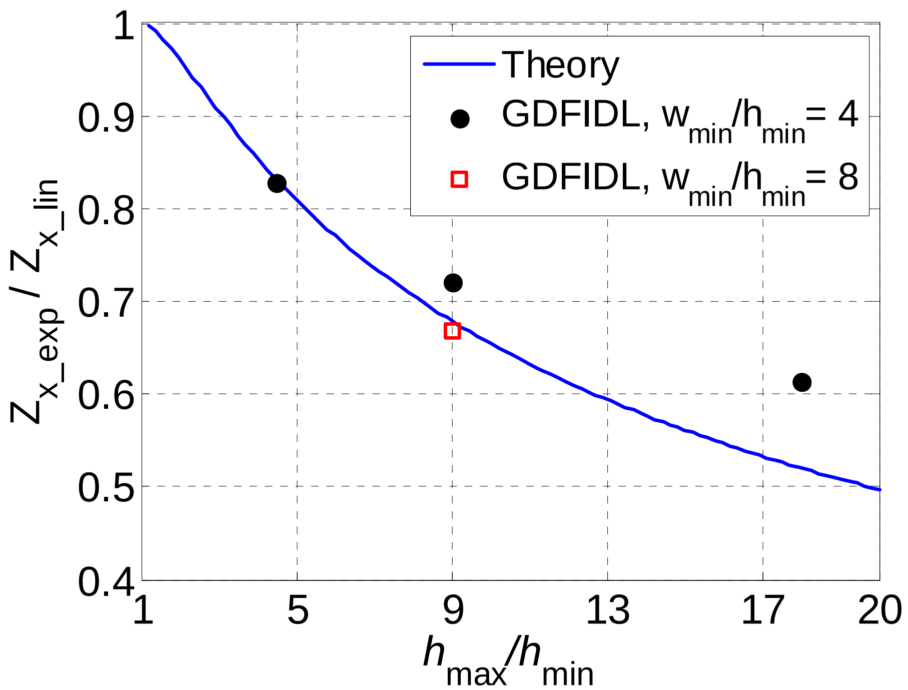
Each taper subdivided into 4 linearly tapered pieces to approx. nonlinear boundary.

Gradual tapers in convex geometry

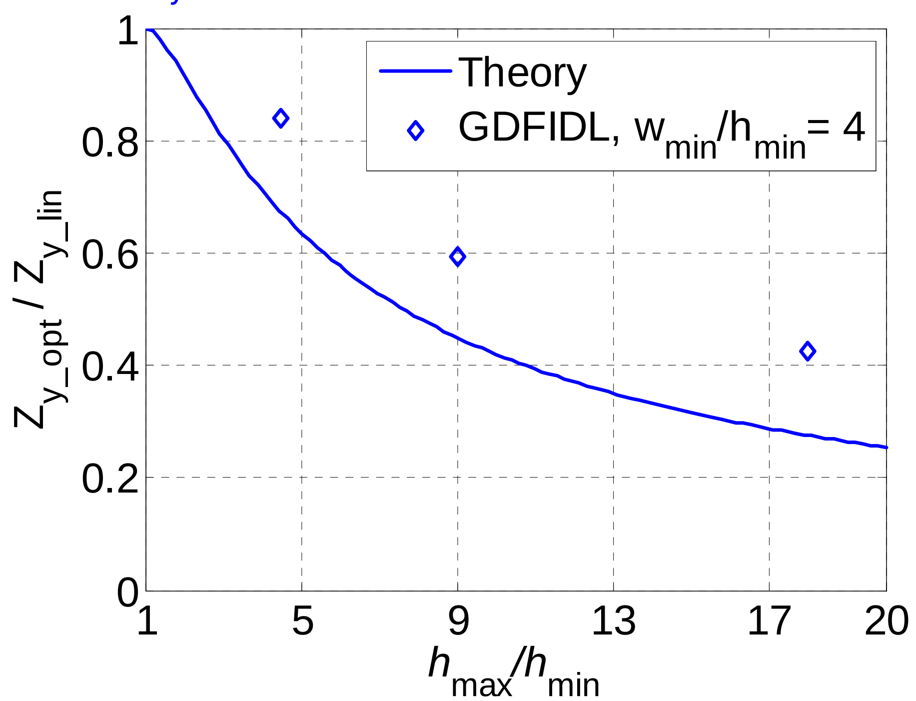
Long straight pipes to avoid "interaction" between two tapers

Impedance Reduction for Elliptical X-Section Tapers

Z_x reduction for exponential tapering



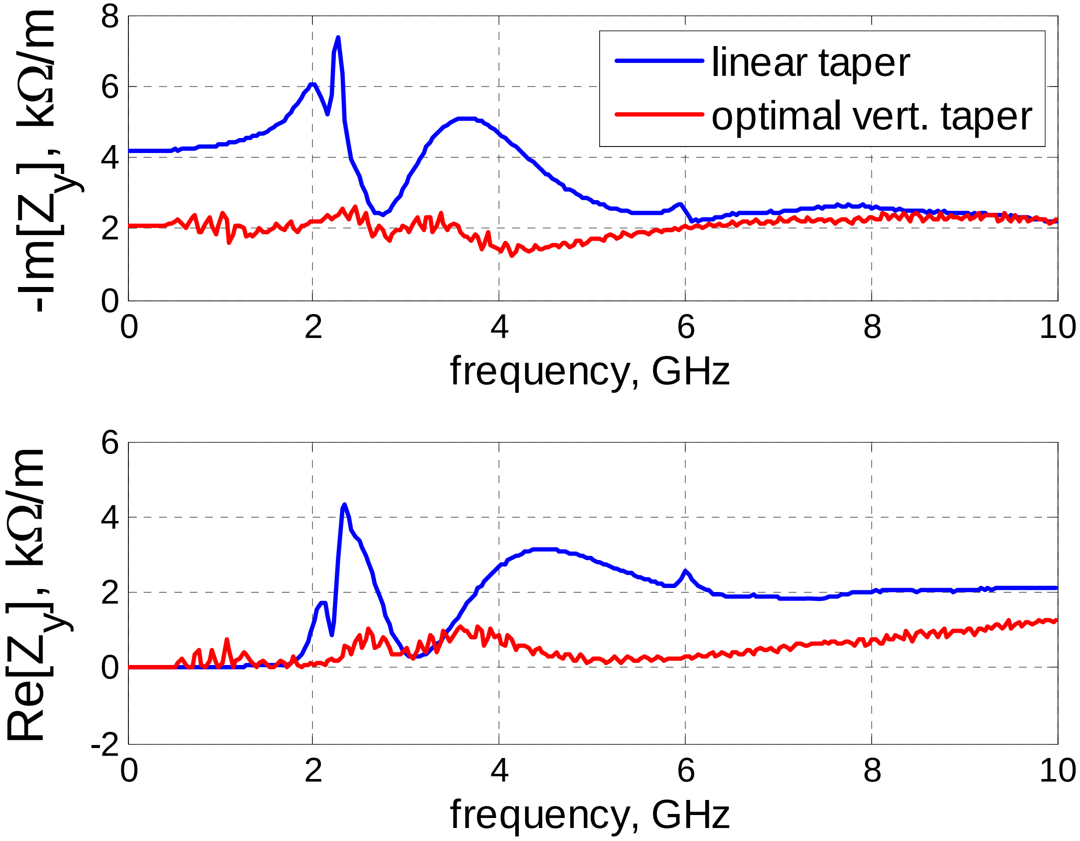
Z_y reduction for optimal vert. tapering



Z_x[kΩ/m] and reduction due to exponential taper agree well with theory

Z_y[kΩ/m] is less than theory; Z_y gets reduced due to optimal taper less than predicted

Impedance Reduction vs. Frequency for Elliptical X-Section



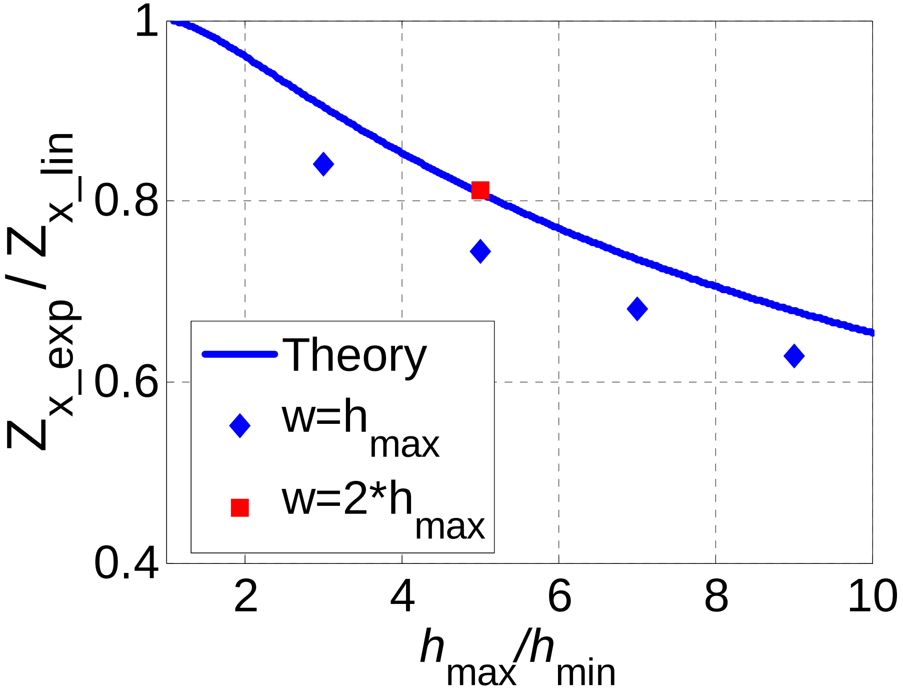
$h_{max}/h_{min} = 18$

Z_y reduction extends through inductive regime (k~$1/w_{min}$) & beyond

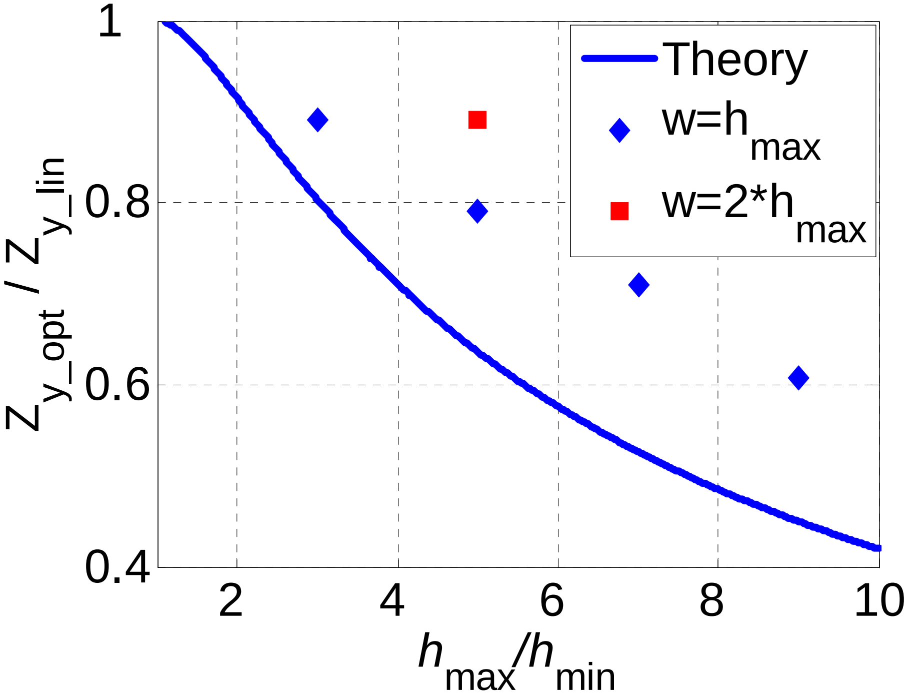
Z_x reduction extends through inductive regime (k~$1/h_{min}$) & beyond

Impedance Reduction for Rectangular X-Section Tapers

Z_x reduction for exponential tapering



Z_y reduction for optimal vert. tapering



Z_x[kΩ/m] and reduction due to exponential taper agree well with theory

Z_y[kΩ/m] is less than theory; Z_y gets reduced due to optimal taper less than predicted

Results are very similar to elliptical structure

Conclusion

- For gradual tapers with large cross-sectional changes substantial reduction in geometric impedance is achieved by nonlinear taper.
- Theoretical predictions for impedance reduction are confirmed by EM solvers for axially symmetric structures and for Z_x of flat 3D structures. The vertical impedance gets reduced less than predicted, but the linear taper Z_y is lower as well.
- Optimal tapering for Z_x reduces Z_y as well and vice versa. Impedance reduction holds with frequency through the entire inductive impedance range and beyond.
- For fixed transition length, the *h*(z) tapering we consider appears to be the only “knob” to reduce transverse broadband geometric impedance of tapered structures.

Acknowledgements

•Many thanks to S. Krinsky and G.V. Stupakov for insightful discussions and to W. Bruns, A. Blednykh, and P.J. Chou for help with GDFIDL.

•We thank CST GmbH for letting us use CST Microwave Studio for mesh generation for ECHO simulations.

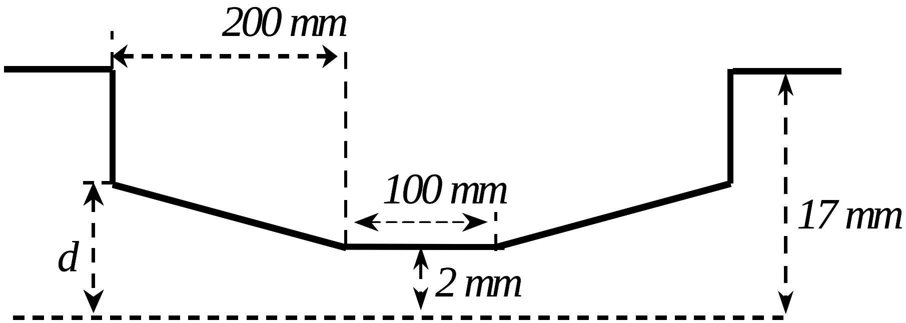
•Thanks to the PAC07 Program Committee for selecting this work for oral presentation.

•Work supported by DOE contract number DE-AC02-98CH10886 and by EU contract 011935 EUROFEL.

EXTRAS

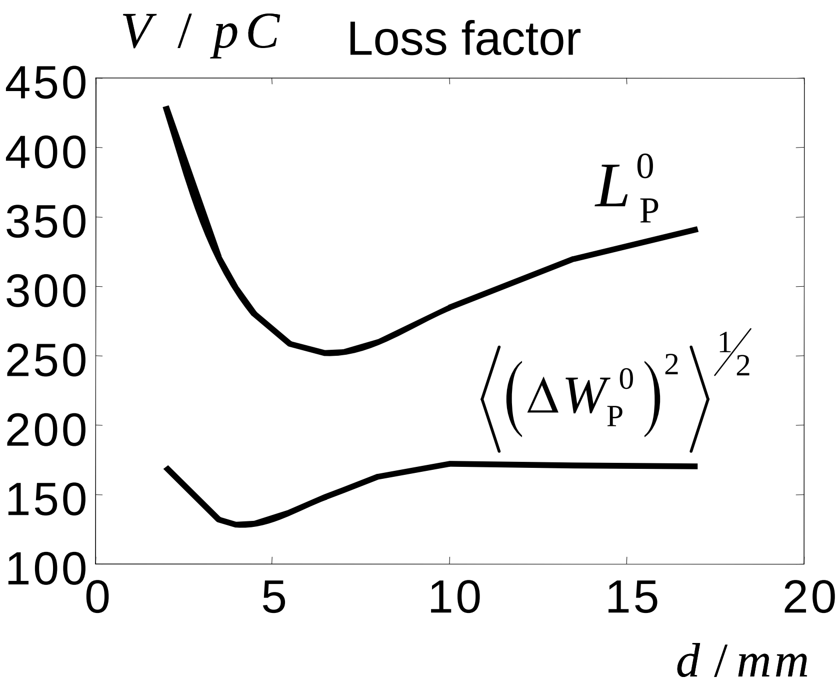
FLASH (DESY) collimators. Tapering

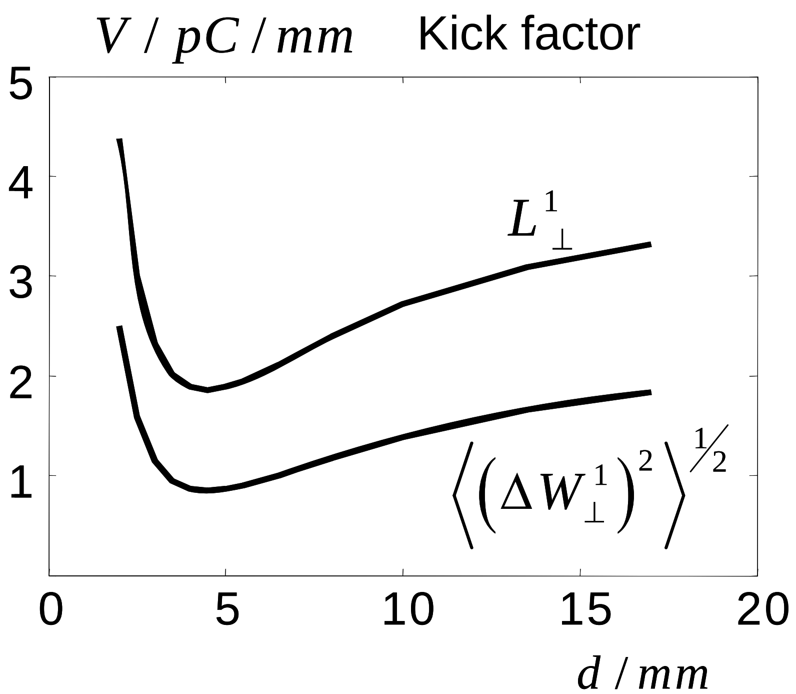
Geometry of the “step+taper” collimator



Bunch length

$$\sigma_z = 0.05\ \mathrm{mm}$$





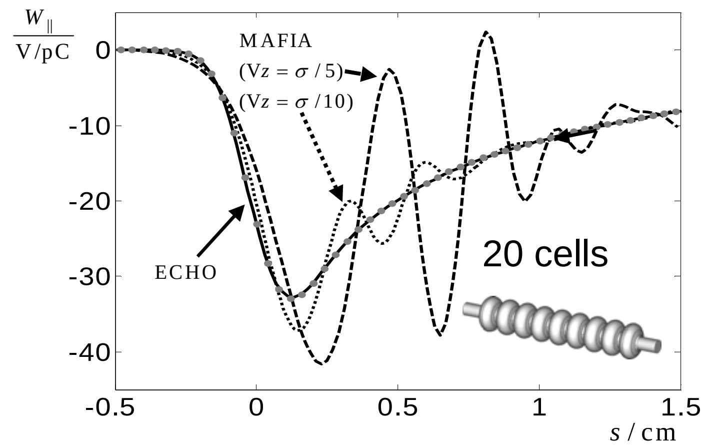
Collimator geometry optimization.

Optimum d ~ 4.5mm

Wakefield code ECHO (TU Darmstadt / DESY)

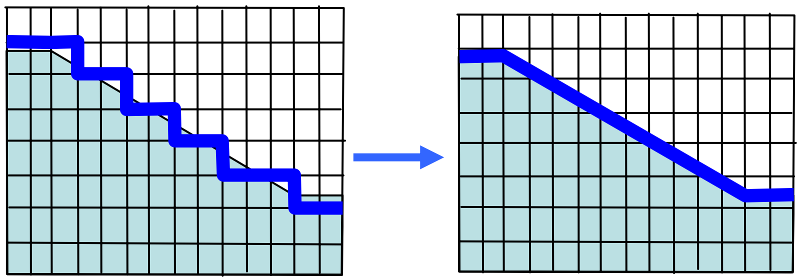
➢ **zero dispersion** in longitudinal direction.

$$\Delta z : \begin{cases} \sigma, \text{ in ECHO} \\ \sqrt{\dfrac{\sigma^3}{L}}, \text{ in MAFIA} \end{cases}$$



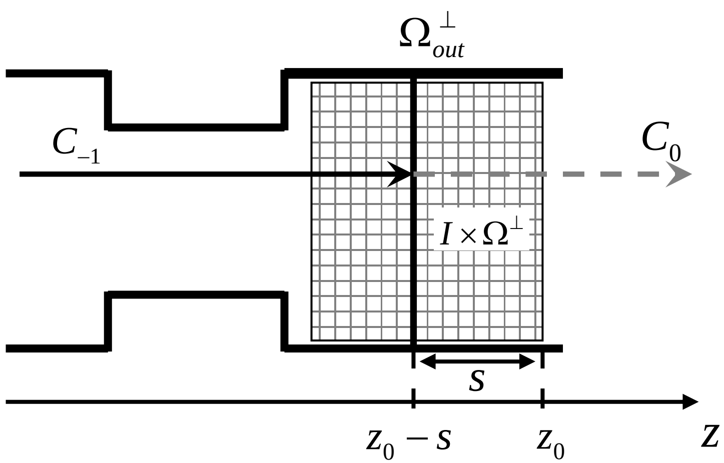
➢ **staircase free** (second order convergent)

O(h) → O(h²)



➢ **moving mesh** without interpolation

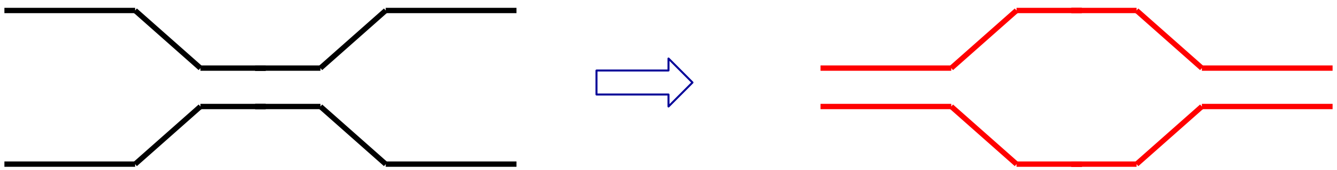
➢ **indirect integration**



Convex vs. Concave

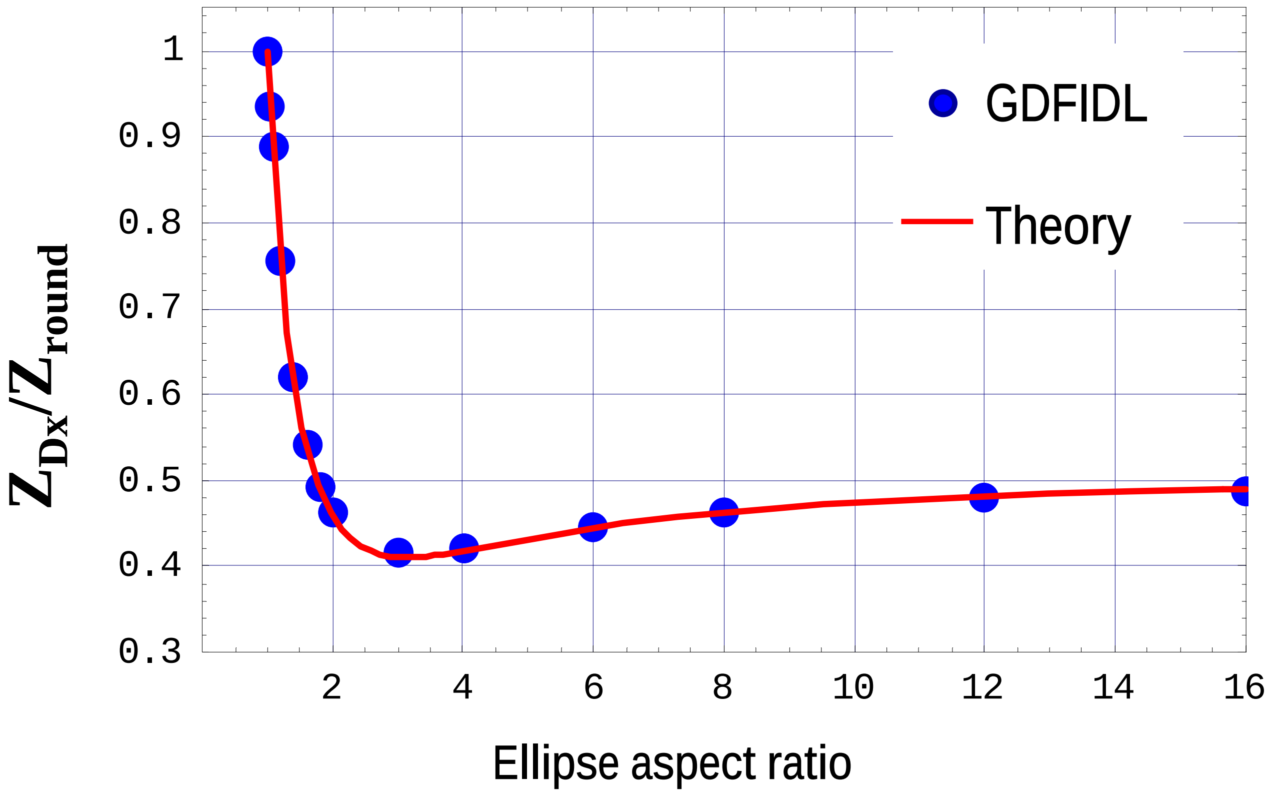
Not a real ID chamber but rather somethnig to test the theory

- For fixed mesh size ABCI and GDFIDL are more precise for convex structures



Same BB impedance, same theory, but easier EM calculations

Results: Horizontal Impedance



- Good agreement between GDFIDL and theory
- “Flat value” of $Z_{round}/2$ at aspect ratios >~2
